|                                                                               |           |
|-------------------------------------------------------------------------------|-----------|
| <b>1. Introduction .....</b>                                                  | <b>8</b>  |
| Key Features .....                                                            | 8         |
| Web-based Operation .....                                                     | 8         |
| Auto Discovery and Topology Visualization .....                               | 8         |
| Event Management .....                                                        | 8         |
| Configuration and Firmware Management .....                                   | 8         |
| Traffic Monitoring .....                                                      | 8         |
| System Requirements .....                                                     | 9         |
| Supported Devices .....                                                       | 9         |
| <b>2. Installation and Uninstallation .....</b>                               | <b>10</b> |
| Installation Procedure .....                                                  | 10        |
| For Windows .....                                                             | 10        |
| For Ubuntu .....                                                              | 10        |
| Uninstallation .....                                                          | 11        |
| For Windows .....                                                             | 11        |
| For Ubuntu .....                                                              | 11        |
| <b>3. Getting Started .....</b>                                               | <b>12</b> |
| MXview One Control Panel .....                                                | 12        |
| Server Control .....                                                          | 12        |
| Configuration .....                                                           | 13        |
| DB Backup & Restore .....                                                     | 16        |
| Plug-in Manager .....                                                         | 18        |
| Certificates .....                                                            | 25        |
| Starting the MXview One Server and Logging Into MXview One .....              | 36        |
| Logging Into MXview One Remotely .....                                        | 37        |
| License Management .....                                                      | 40        |
| Checking the License .....                                                    | 40        |
| Adding a New License .....                                                    | 41        |
| Using Device Discovery .....                                                  | 42        |
| Account Management .....                                                      | 44        |
| Adding User Accounts .....                                                    | 45        |
| Modifying User Accounts .....                                                 | 45        |
| Editing Accessible Groups .....                                               | 46        |
| Deleting User Accounts .....                                                  | 47        |
| Exporting User Accounts .....                                                 | 47        |
| Configuring the Password Policy .....                                         | 47        |
| Configuring Login Notifications .....                                         | 48        |
| Changing the Display Language .....                                           | 49        |
| <b>4. License Management .....</b>                                            | <b>50</b> |
| License Management Overview .....                                             | 50        |
| License Type .....                                                            | 51        |
| Adding a New License .....                                                    | 52        |
| Adding an Add-on License .....                                                | 54        |
| Deactivating a License .....                                                  | 57        |
| Reactivating a Deactivated License .....                                      | 58        |
| Transferring a License to a Different Instance of MXview One .....            | 60        |
| Quantity of Monitored Devices Exceeds the Number of Node-based Licenses ..... | 62        |
| <b>5. Dashboard Widgets .....</b>                                             | <b>64</b> |
| Dashboard Overview .....                                                      | 64        |
| Device Summary .....                                                          | 64        |
| Event Highlights .....                                                        | 65        |
| <b>6. Device Discovery and Polling .....</b>                                  | <b>66</b> |
| Device Discovery Overview .....                                               | 66        |
| Configuring IP Address Scan Ranges .....                                      | 67        |
| Configuring Device Polling Settings .....                                     | 69        |
| Changing the Default SNMP Configuration .....                                 | 71        |
| Changing Modbus TCP Settings .....                                            | 72        |
| Changing EtherNet/IP Settings .....                                           | 72        |

|                                                                                     |            |
|-------------------------------------------------------------------------------------|------------|
| Changing Siemens S7comm Settings .....                                              | 73         |
| <b>7. Topology Management.....</b>                                                  | <b>74</b>  |
| Topology Overview .....                                                             | 74         |
| Viewing the Topology Map .....                                                      | 75         |
| Viewing Recent Events .....                                                         | 77         |
| Organizing the Topology Structure By Group Function .....                           | 79         |
| Redundant Topologies .....                                                          | 82         |
| PoE Power Consumption Visualization.....                                            | 82         |
| VPN Tunnel Visualization .....                                                      | 83         |
| Port Trunking .....                                                                 | 83         |
| Adding Devices and Links .....                                                      | 84         |
| Deleting Devices and Links .....                                                    | 86         |
| Updating the Topology Map.....                                                      | 86         |
| Refreshing the Topology Layout.....                                                 | 87         |
| Creating a New Topology Map .....                                                   | 88         |
| Setting/Editing the Background Image .....                                          | 89         |
| Editing the Topology Appearance.....                                                | 90         |
| Editing the Device Appearance .....                                                 | 94         |
| Exporting the Topology Map.....                                                     | 96         |
| <b>8. Network and Traffic Monitoring .....</b>                                      | <b>97</b>  |
| Viewing Link Properties .....                                                       | 97         |
| Viewing Port Traffic.....                                                           | 98         |
| Viewing Packet Error Rates .....                                                    | 99         |
| Monitoring Traffic Loads .....                                                      | 100        |
| Monitoring Network Security .....                                                   | 100        |
| Configuring Severity Thresholds for Traffic and Fiber Status Monitoring Events..... | 105        |
| Configuring Custom Port Labels .....                                                | 108        |
| <b>9. SFP Fiber Status .....</b>                                                    | <b>109</b> |
| Viewing the SFP Fiber Status in Table View .....                                    | 109        |
| Synchronize the SFP Threshold From the Device.....                                  | 110        |
| <b>10. Device Operation in the Topology.....</b>                                    | <b>111</b> |
| Viewing the Device List.....                                                        | 111        |
| Importing Device Configurations.....                                                | 114        |
| Exporting Device Configurations .....                                               | 115        |
| Upgrading Firmware.....                                                             | 116        |
| Configuring SNMP Trap Server .....                                                  | 117        |
| Configuring Port Settings.....                                                      | 118        |
| Configuring SNMP Communication Protocol .....                                       | 119        |
| Configuring MXview One Polling Interval.....                                        | 120        |
| Configuring Device Accounts .....                                                   | 121        |
| Modifying the Device Alias .....                                                    | 122        |
| Changing the Device Icon .....                                                      | 123        |
| Signing on to Device Web Consoles.....                                              | 124        |
| Managing and Running Scripts .....                                                  | 125        |
| Running a CLI Script.....                                                           | 125        |
| Running a Saved CLI Script .....                                                    | 128        |
| Changing Device Groups.....                                                         | 130        |
| Refreshing the Device Status .....                                                  | 131        |
| Deleting Devices.....                                                               | 131        |
| <b>11. Device Management .....</b>                                                  | <b>132</b> |
| Configuration and Control .....                                                     | 132        |

# 1. Introduction

---

The Moxa MXview One network management software consists of four parts: The Main Module, Power Add-on Module, the Wireless Add-on Module, and the Security Add-on Module. The Moxa MXview One network management software gives you a convenient graphical representation of your Ethernet network, and allows you to configure, monitor, and diagnose Moxa networking devices. MXview One provides an integrated management platform that can manage Moxa networking devices, such as Ethernet switches, wireless APs, SNMP-enabled, and ICMP-enabled devices installed on subnets. The MXview Power Add-on Module provides additional advanced functions for power substation applications. The MXview Wireless Add-on Module provides additional advanced functions for wireless applications to monitor and troubleshoot your network, and help you minimize downtime. The Security Add-on Module provides additional advanced functions to enhance field security, including centralized management and deployment of firewall policies, and updating cybersecurity packages.

## Key Features

### Web-based Operation

You will need to install MXview One on a Windows computer connected to the network(s) that are to be managed. After installing MXview One, the network can be managed using Chrome, Firefox, or Microsoft Edge, without installing additional software.

### Auto Discovery and Topology Visualization

Within the Device Discovery, MXview One locates networking devices with SNMP or ICMP services enabled. MXview One can collect topology information from devices with LLDP capability and draw the topology of the network, which shows wired and wireless connections. For ICMP devices without LLDP, MXview One can verify the connection relationship through ARP algorithms, and help you create an accurate drawing of the network topology. If any managed PoE switches are in your network, the PoE power output information will also be visualized automatically.

### Event Management

For troubleshooting purposes, MXview One logs events that match predefined conditions, such as link up/down, device unreachable, or traffic overloading. The most recent events will be displayed to inform users of the networking status. Devices and links that generate events will be highlighted with different colors. When an event occurs, users can be notified by email, Microsoft Teams, or message box.

### Configuration and Firmware Management

MXview One provides an interface for managing Moxa networking devices from a central location. Users can remotely backup or update configuration files, and upgrade firmware via MXview One.

### Traffic Monitoring

MXview One can log the network traffic of network devices that have been discovered.

# System Requirements

The computer that MXview One is installed on must satisfy the following system requirements:

|                             | System Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU                         | Quad-core CPU or better                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RAM                         | 16 GB or higher                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hard Disk Space             | SSD 1 TB or higher                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Supported Devices

MXview One supports a full range of functions, such as network status, traffic log, and configuration/firmware file management.

- For other SNMP-enabled devices, MXview One supports standard management functions, such as link up, link down, and SNMP MIBII information.
- MXview One can only monitor the connectivity of devices that support ICMP.

Please check the MXview One datasheet on [moxa.com](https://www.moxa.com) for a list of Moxa devices that are supported.

## 2. Installation and Uninstallation

---

### Installation Procedure

#### For Windows

1. Execute the installation program.
2. During the installation, you can check the EULA (End-User License Agreement) and choose the directory in which MXview One will be installed and the default language, or leave the settings as the default values.
3. After the installation is complete, shortcuts for launching the MXview One server will be created on the desktop and in the start menu.

#### NOTE

If your computer already has MXview installed, please uninstall it and then start the MXview One program installation process.

#### For Ubuntu

For Ubuntu installation instructions, please refer to the **MXview One Linux Installation Guide**, which can be downloaded from the Moxa website.

There are two ways to install MXview One on Linux Ubuntu: offline and online installation. We recommend installing MXview One using the **offline method first** to avoid any compatibility issues.

If you are unable to activate MXview One using the online installation method, install the software using the offline method.

# Uninstallation

## For Windows

1. Locate the **Control Panel** in Windows.
2. Under **Programs**, click **Uninstall a program**.  
The **Uninstall or change a program** screen appears.
3. Select **MXview One**
4. Click **Uninstall** or **Uninstall/Change** at the top of the program list.

## For Ubuntu

Execute the command line:

```
#sudo apt remove mxview
```

## 3. Getting Started

---

### MXview One Control Panel

#### Server Control

**For Ubuntu users:**

Execute the following command to activate MXview One Control Panel:

```
#sudo /usr/mxview/mxview-control-panel/MXControlPanel
```

Open a web browser and navigate to [https://\[host IP address\]:7100](https://[host IP address]:7100). The host IP address is the IP of the computer running MXview One. The default IP address is: 127.0.0.1

To stop MXview One in Linux, press CTRL + C.

**For Windows users:**

Start the MXview One server on the computer before launching the MXview One web console. On the server computer, double-click the MXview One desktop shortcut in the Windows operating system.

The MXview One Control Panel log in screen appears first and after logging in will direct to the Control Panel.

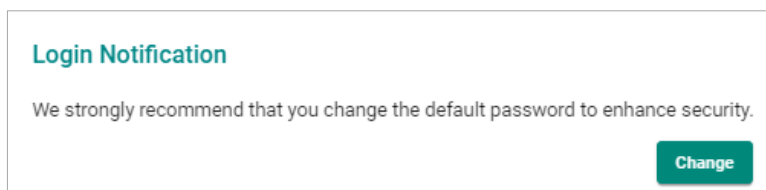

Provide the following login credentials

- **Username:** The default username is **admin**.
- **Password:** The default password is **moxa**.

After logging in with the default credentials, the system will display a message asking you to change the default password to enhance security.

After clicking the **Change** button, the **Change Password** window will appear.

The screenshot shows the 'Change Password' form. It has three input fields: 'Old Password \*', 'New Password \*', and 'Confirm New Password \*'. Each field has a placeholder text and a toggle icon. Below each field is a character count '0 / 128'. At the bottom right is a 'Change' button.

## Configuration

Configure the following port numbers in the **Configuration** Page:

The screenshot shows the MXview One Control Panel interface. On the left is a sidebar with navigation links: Server Control, Configuration (highlighted), DB Backup & Restore, Plug-in Manager, and Certificates. The main content area is titled 'MXview One Central Manager Server Settings'. It contains several configuration fields:

- Enable \***: A dropdown menu with 'Yes' selected.
- Manage Licenses Through MXview One Central Manager \***: A dropdown menu with 'Yes' selected.
- Server Address \***: A section with two input fields:
  - IP/Domain Name**: A text input field containing 'IP/Domain Name'.
  - Port**: A text input field containing '8883'. Below it, a small text '1-65535' indicates the valid range.
- Authentication \***: A section with a **Password** input field. Below the field, it says 'At least 8 characters' and '0 / 63'. There is an eye icon to toggle password visibility.
- Site ID \***: A text input field containing 'Site ID'.

## MXview One Central Manager Server Settings

- **Enable**
  - **Yes:** This MXview One site will be managed through MXview One Central Manager. This requires the below MXview One Central Manager settings to be configured.
  - **No:** The MXview One site operates independently and cannot be managed through MXview One Central Manager.
- **Manage Licenses through MXview One Central Manager**
  - **Yes:** All the licenses of this MXview One site will be managed through MXview One Central Manager.
  - **No:** The licenses for this site are managed locally at the MXview One site.
- **Server Address**
  - **IP/Domain Name:** The IP address of MXview One Central Manager.
  - **Port:** The service port used to connect to MXview One Central Manager. The default port number is 8883.
- **Authentication**
  - **Password:** The password used to connect to MXview One Central Manager.
- **Site ID**
  - **Site ID:** This value represents the site ID as shown on the Site Management page in MXview One Central Manager.

## Interface Settings

**MXview One Central Manager Server Settings**

Enable \* No

1-65535

---

**Database Interface**

Port \* 5402  
1-65535

Password \* \*\*\*\*\* At least 8 characters 16 / 63

---

**Microservices Interface** ⓘ

Port

Internal Service Port 1 \* 8883  
1-65535

Password

Internal Service Port 2 \* 8882  
1-65535

Password

Auto Binding

Security Add-on Service Port \* Enabled Port 18883  
1-65535

**Save**

- **Web Interface**
  - **HTTPS:** Specify the HTTPS port of the MXview One Central Manager server. The default port is 443.
  - **HTTP:** Enable or disable HTTP. If enabled, specify the listening port of the server. The default port is 80.
- **Database Interface**
  - **Port:** Specify the service port of the MXview One Central Manager database server. The default port is 5432.
  - **Password:** The password used to connect to MXview One Central Manager. While the default password is randomized, we strongly recommend you to change the password to enhance security.
- **Microservices Interface**
  - **Internal Service Port 1/2:**
    - i. **Port:** Specify the communication ports between MXview One and its internal system. The default ports are 8883 and 8882.
    - ii. **Password:** The password used for the microservices interface. While the default password is randomized, we strongly recommend you changing the password to enhance security.
  - **Security Add-on Service Port:**
    - i. **Auto Binding:** Enable or disable the auto-binding feature. When enabled, MXview One will automatically select a random port number for the Security add-on module if the default port number is already in use.
    - ii. **Port:** Specify the service port of the Security add-on module.

When finished, click **Save**.

## DB Backup & Restore

1. Navigate to **DB Backup & Restore** on the MXview One Control Panel.

The Database Backup & Restore screen will appear and includes **Backup** and **Restore** functions.

The screenshot shows the MXview One Control Panel interface. On the left is a sidebar with navigation links: Server Control, Configuration, DB Backup & Restore (highlighted), Plug-in Manager, and Certificate. The main area has two tabs: Backup and Restore. The Backup tab is active, showing a form with a 'Name \*' label and a text input field. Below the input field is a 'Save' button. A character count '0 / 255' is visible at the bottom right of the input field.

2. Choose the **Backup** tab to start the process of backing up the database.
3. In the **Name** field, specify the backup file name.
4. Click **Save**.
5. The message that the file of the backup database has been stored in the specified directory will be displayed.

The database has been backed up to  
C:\Users\ [redacted] \AppData\Roaming\moxa\mxview  
one\db\_backup\20230709\_120518

6. When the database has been backed up successfully it will appear in the **Historical backups** list.

The screenshot shows the MXview One Control Panel interface after a successful backup. The 'Backup' tab is active, and the 'Name' field now contains 'Backup test'. A green 'Save' button is visible. Below the form is a section titled 'Historical backups' containing a table with the following data:

| Version | Name         | Date     | Time     |
|---------|--------------|----------|----------|
| 1.1     | Backup test  | 20221215 | 13:23:37 |
| 1.1     | Backup test2 | 20221215 | 13:42:02 |
| 1.1     | XXX-20221223 | 20221223 | 14:09:09 |

The system backup file includes the following items:

- Topology
- Traffic
- Availability
- Event
- Threshold settings
- Maintenance scheduler settings
- OID items
- Trap items
- System settings
- System Restore

The MXview One system will restore the system configurations from a backup file.

1. Click the **Restore** Tab.

2. Choose the backups you want to restore in the table. You can also copy a database to a specific path and then press the refresh button to get the latest result.

3. Click **Restore**.

A confirmation screen will appear.

4. Displaying the restoration process.

5. Click **Close**.

# Plug-in Manager

Navigate to **Plug-in Manager** on the **Control Panel**. The Plug-in Manager is a tool that can be used to manage the plug-in files. The **Plug-in Manager** screen features two tabs: **Moxa Devices** and **SNMP Devices**.

## Moxa Devices

When you discover a new Moxa product that has not been integrated in to the latest MXview One version, you may not be able to retrieve the product information from MXview One. To solve this, you can download the plug-in file from Moxa's website, and then upload the file in the Plug-in Manager. After uploading the plug-in files, these new models can be supported by MXview One.

The **Plug-in Manager** screen includes the following information:

- Plug-in file version
- Upload a Plug-in file
- Supported device model

The screenshot shows the 'MXview One Control Panel' with a sidebar menu containing 'Server Control', 'Configuration', 'DB Backup & Restore', 'Plug-in Manager' (selected), and 'Certificates'. The main area is titled 'Plug-in Manager' and has two tabs: 'Moxa Devices' (active) and 'SNMP Devices'. Below the tabs, it displays 'Plug-in Version v1.3.231226'. A message box states: 'You can get the latest plug-in file from the Moxa website. If you already have the plug-in file, please verify that the checksum of the plug-in file is the same as the checksum on the Moxa website.' Below this is an 'Upload a plug-in file' section with a 'Select a plug-in file' button and an 'Upload' button. Further down is a 'Supported Device Model(300)' section with a search bar and a table of supported models.

| Model          |
|----------------|
| AWK-1131A      |
| AWK-1137C      |
| AWK-1151C      |
| AWK-1165A      |
| WAC-2004       |
| TAP-6226       |
| AWK-3131A      |
| AWK-3252A      |
| AWK-1161A      |
| AWK-1165C      |
| TAP-213        |
| EDS-G512E-8PcE |
| AWK-4131A      |
| AWK-4252A      |
| AWK-1161C      |
| WAC-1001       |
| TAP-323        |
| EDS-528E       |

### Steps to Upload a Plug-in File:

1. Stop MXview One.

The screenshot shows the 'MXview One Control Panel' with a sidebar menu. The main area displays a 'Service stopped' message with a red circle icon. Below the message, it says 'Click Start to begin monitoring your network.' and provides two buttons: 'Start' and 'Open MXview One'. A box below the buttons lists the following ports: 'HTTP port is disabled', 'HTTPS Port: 550', 'Database Port: 5432', 'Internal Service Port 1: 8883', and 'Internal Service Port 2: 8882'.

2. Download the latest plug-in file from the Moxa website. <https://www.moxa.com/en/products/industrial-network-infrastructure/network-management-software/mxview-one-series#resources>

3. Navigate to the **Plug-in Manager** on the **Control Panel**.

The screenshot shows the MXview One Control Panel interface. On the left is a sidebar with navigation links: Server Control, Configuration, DB Backup & Restore, Plug-in Manager (highlighted), and Certificates. The main content area is titled 'Plug-in Manager' and has two tabs: 'Moxa Devices' (selected) and 'SNMP Devices'. Below the tabs, it displays 'Plug-in Version v1.3.231226'. A teal information box contains a message about downloading the latest plug-in file from the Moxa website and verifying the checksum. Below this is a section 'Upload a plug-in file' with a text input 'Select a plug-in file' and a folder icon button. An 'Upload' button is below the input. Further down is a section 'Supported Device Model(300)' with a search input. At the bottom is a table of supported devices.

| Model     |                |           |
|-----------|----------------|-----------|
| AWK-1131A | AWK-3131A      | AWK-4131A |
| AWK-1137C | AWK-3252A      | AWK-4252A |
| AWK-1151C | AWK-1161A      | AWK-1161C |
| AWK-1165A | AWK-1165C      | WAC-1001  |
| WAC-2004  | TAP-213        | TAP-323   |
| TAP-6226  | EDS-G512E-8PoE | EDS-528E  |

4. Click the folder (  ) icon in **Select a Plug-in File** to upload the file (.zip) from your local machine.
5. Click **Upload** and if successful, the message below will be displayed.  
MXview One will upload the plug-in file and display the supported devices.

A dark grey rectangular box with the text 'Successfully updated' in white.

## SNMP Devices

By default, MXview One will show basic information for third-party SNMP devices by polling the RFC-1213 public MIB and does not require users to upload device plug-in files. MXview One can also monitor the status of these SNMP devices.

To show more detailed information for third-party SNMP devices in MXview One, users can create an SNMP device plug-in by uploading the device's private MIB files and defining the OID and OID syntax mapping.

The tab SNMP Devices includes the following information:

- Upload a plug-in file: This function allows users to upload plug-in files for third-party SNMP devices.
- Supported Device Model: This is the third-party SNMP device plug-in list, including built-in and user-defined SNMP plug-in. You can edit, download but cannot delete the built-in plug-in. If your third-party device is not in the list, you can create a new SNMP plug-in, and please refer to the Create a Plug-in

## Creating a Plug-in

Steps to **Create an SNMP Plug-in**:

1. Navigate to **Control Panel > Plug-in Manager > SNMP Devices**.
2. Click the **Add** (  ) icon.  
The **Add an SNMP Model Plug-in** screen will appear.

The screenshot shows the 'Add an SNMP Model Plug-In' interface in the MXview One Control Panel. The interface has a sidebar on the left with options: Server Control, Configuration, DB Backup & Restore, Plug-in Manager (selected), and Certificates. The main area has a breadcrumb '< Add an SNMP Model Plug-In' and a progress bar with four steps: 1. Specify sysObjectID, 2. Load Device Files, 3. Select and Test OIDs, and 4. OID Alias and Value Definition. Step 1 is active. It contains two text input fields: 'sysObjectID \*' (0 / 255) and 'Model \*' (0 / 40). A 'Get sysObjectID' button is next to the first field. A 'Next' button is at the bottom left.

There are four steps to creating a third-party SNMP device plug-in file:

3. Specify sysObjectID.

- a. **sysObjectID**: You can manually type in the sysObjectID or click the **Get sysObjectID** button to let MXview One retrieve the sysObjectID. When clicking the **Get sysObjectID** button, the **Get sysObjectID From a Device** window will appear.

The screenshot shows the 'Get sysObjectID From a Device' dialog box. It contains the following fields: IP Address \* (192.168.127.32), SNMP Settings \* (SNMP Version: V1, Port: 161), Username (0 / 32), Password (0 / 64), Read Community (public, 6 / 32), Data Encryption (NoAuth), Authentication (MD5), Encryption Protocol (DES), and Encryption Password (0 / 64). At the bottom right, there are 'Cancel' and 'Get sysObjectID' buttons. The 'Get sysObjectID' button is highlighted with a red rectangle.

After specifying all the necessary information, click **Get sysObjectID**. If successful, a confirmation message will appear.

**Model**: Specify the model name. The model name only supports A-Z a-z 0-9 \_ - , (comma) ( ) and space.

- b. When finished, click **Next**.

4. Load Device Files.

- a. **MIB Files**: Upload all the necessary You can upload multiple MIB files at once.
- b. **Icon File**: Upload the device icon in PNG format. The maximum resolution is 150 x 150 px. The maximum file size is 500 KB limit.
  - ☐ **Icon Preview**: The icon preview will show the uploaded image as it will appear in the topology.

Back Complete

If necessary, you can manually edit the OID information.

- Click the **Pencil** (  ) icon of the OID you want to edit. The **Custom Name and Syntax** window will appear.

**Custom Name and Syntax**

Alias for OID Name \*

OID Name hmMgmtDiscIntfType

OID Alias  4 / 64

OID Syntax Mapping

OID Syntax Integer32(loopback-intf(1),router-intf(2),mgmt-intf(3))

OID Syntax Mapping

+ Value Display Name

1 loopback-intf 1 / 64 13 / 64

2 router-intf 1 / 64 11 / 64

3 mgmt-intf 1 / 64 9 / 64

Cancel Apply

- Edit the OID Alias and OID Syntax Mapping information as required.
  - When finished, click **Apply**.
- When finished with all four steps, click **Complete**. The **Update Plug-in** window will appear.

**Update Plugin**

MXview One stopped      **Updating**      Starting MXview One

8. If successful, a confirmation will appear indicating the plug-in was created.

The plug-in will now show in the **Supported Device Model** list.

## Certificates

From the **Certificate** page, you can view the certificates used by MXview One. By default, you can view information for **Web** certificates. If this MXview One instance is managed through MXview One Central Manager, an additional **MQTT** certificate tab will be available.

### Web Certificates

On the **Web** tab, you can view the information for the current web certificates, including:

- Issue To - Common Name (CN)
- Issue By - Common Name (CN)
- Issue By - Organization (O)
- Issued On
- Expires On

## Regenerating the Web Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **Web** tab.
3. Click the **Regenerate** button.

The **Regenerate Certificate** window will appear.

4. Click **Regenerate** to regenerate the certificate.

5. After successfully regenerating the certificate, MXview One Central Manager Control Panel will need to be restarted for the certificate to take effect. Click Close and restart the instance.

## Importing a Web Certificate

You can manually import a certificate file and key file.

1. Navigate to **Control Panel > Certificates**.
2. Go to the **Web** tab.
3. In the **Import Certificate** section, click the folder icon for the Private Key and CA Certificate fields and navigate to the certificate (.crt, .cer) and key (.key) file on the local host.

**Import Certificate**

Private Key (.key) \*

CA Certificate (.crt, .cer) \*

**Import**

4. Click **Import**.
5. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

**Restart Required**

Please restart MXview One Control Panel and MXview One to activate the certificate.

**Close**

## OPC UA Server Certificates

On the **OPC UA Server** tab, you can view the information for the current OPC UA certificates, including:

- Issue To – Common Name (CN)
- Issue By – Common Name (CN)
- Issue By – Organization (O)
- Issued On
- Expires On

## Regenerating the OPC UA Server Certificate

1. Navigate to **Control Panel > Certificates**.
  2. Go to the **OPC UA Server** tab.
  3. Click the **Regenerate** button.
- The **Regenerate Certificate** window will appear.

Web    **OPC UA Server**    Syslog Server    Syslog Forwarding

Wednesday, Jul 19, 2024 at 12:00:00 AM

**Regenerate**    **Export Certificate**

4. Click **Regenerate** to regenerate the certificate.

5. After successfully regenerating the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

## Exporting the OPC UA Server Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **OPC UA Server** tab.
3. Click the **Export Certificate** button.  
MXview One will export the OPC UA certificate as a ZIP file.

## Importing an OPC UA Server Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **OPC UA Server** tab.
3. In the **Import Certificate** section, click the folder icon for the Private Key, Certificate, and CA Certificate fields and navigate to the CA certificate (.crt, .cer), certificate (.pem), and key (.key) file on

the local host.

A dialog box titled "Import Certificate" with a teal header. It contains three input fields, each with a file icon on the right: "Private Key (.key) \*", "Certificate (.pem) \*", and "CA Certificate (.crt, .cer) \*". At the bottom left is a grey "Import" button.

4. Click **Import**.
5. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

## Syslog Server Certificates

On the **Syslog Server** tab, you can view the information for the current syslog server certificates, including:

- Issue To – Common Name (CN)
- Issue By – Common Name (CN)
- Issue By – Organization (O)
- Issued On
- Expires On

## Regenerating the Syslog Server Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **Syslog Server** tab.
3. Click the **Regenerate** button.  
The **Regenerate Certificate** window will appear.

4. Click **Regenerate** to regenerate the certificate.

5. After successfully regenerating the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

## Exporting the Syslog Server Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **Syslog Server** tab.
3. Click the **Export Certificate** button.  
MXview One will export the syslog server certificate as a ZIP file.

## Importing a Syslog Server Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **Syslog Server** tab.
3. In the **Import Certificate** section, click the folder icon for the Private Key, Certificate, and CA Certificate fields and navigate to the CA certificate (.crt, .cer), certificate (.pem), and key (.key) file on

the local host.

A dialog box titled "Import Certificate" with three input fields: "Private Key (.key) \*", "Certificate (.pem) \*", and "CA Certificate (.crt, .cer) \*". Each field has a folder icon on the right. At the bottom left is an "Import" button.

4. Click **Import**.
5. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

## Syslog Forwarding Certificates

On the **Syslog Forwarding** tab, you can view the information for the current syslog forwarding certificates, including:

- Issue To – Common Name (CN)
- Issue By – Common Name (CN)
- Issue By – Organization (O)
- Issued On
- Expires On

### Importing a Syslog Forwarding Certificate

1. Navigate to **Control Panel > Certificates**.
2. Go to the **Syslog Forwarding** tab.
3. In the **Import Certificate** section, click the folder icon for the Private Key, Certificate, and CA Certificate fields and navigate to the CA certificate (.crt, .cer), certificate (.pem), and key (.key) file on

the local host. Repeat these instructions for both the 1st and 2nd syslog forwarding server.

**Import Certificate**

Import

4. Click **Import**.
5. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

## MQTT Certificates

### NOTE

By default, no MQTT certificate will be available. To view MQTT certificate information, import the CA Certificate generated through MXview One Central Manager. Refer to [Importing the MXview One Central Manager CA Certificate](#).

If this MXview One instance is managed through MXview One Central Manager, the MQTT tab will be available. On the **MQTT** tab, you can view the information for the current MQTT certificates, including:

- Issue To - Common Name (CN)
- Issue By - Common Name (CN)
- Issue By - Organization (O)
- Issued On
- Expires On

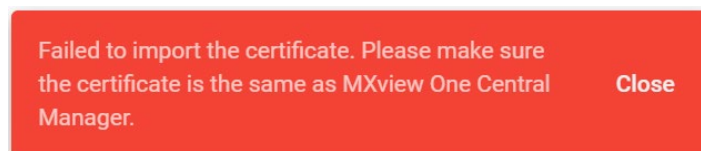

## Importing the MXview One Central Manager CA Certificate

If this MXview One instance is managed through MXview One Central Manager, upload the CA certificate generated through MXview One Central Manager Control Panel here.

1. Click the folder icon for the CA Certificate field and navigate to the certificate file generated through MXview One Central Manager Control Panel on the local host.

If the uploaded certificate is not from Central Manager, an error message will appear.

2. Click **Import**.
3. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

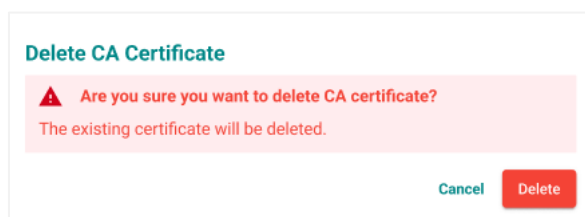

## Deleting the CA Certificate

1. Click **Delete CA Certificate** to delete the current CA certificate file. The **Delete CA Certificate** window will appear.

2. When prompted, click **Delete**.

3. After successfully deleting the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

# Starting the MXview One Server and Logging Into MXview One

1. On the **Server Control** page, click **Start**. The MXview One server will start running.

2. Wait for the status to display **Service is running**, then click **Open MXview One**.

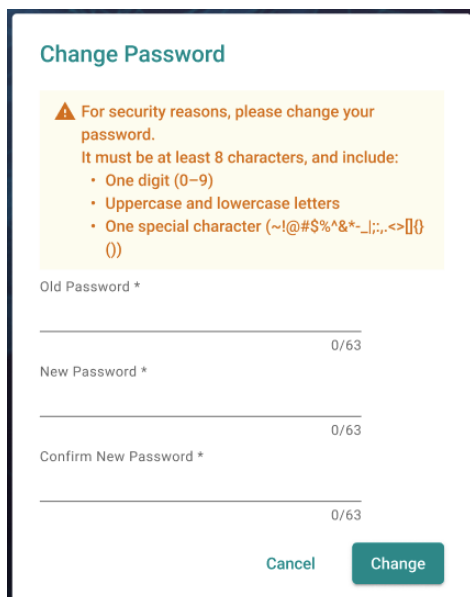

3. Enter the login credentials and click **Log In**.
  - Default username: **admin**
  - Default password: **moxa**

- When logging in using the default credentials, the **Change Password** screen will appear. Enter the old password and specify the new password.

The 'Change Password' screen features a title bar at the top. Below it is a yellow warning box with an orange triangle icon, containing text that advises changing the password for security and lists requirements: at least 8 characters, including one digit (0-9), one uppercase and lowercase letter, and one special character from a specified set. Below the warning box are three input fields: 'Old Password \*', 'New Password \*', and 'Confirm New Password \*'. Each field has a character count indicator (0/63) to its right. At the bottom right, there are two buttons: 'Cancel' and 'Change'.

- Click **Change**.  
The **Password Changed Successfully** screen will appear.

- Click **Close** and log in with the updated password.

## NOTE

Alternatively, you can log in to MXview One from a computer located remotely after starting the MXview One service. For more information, see **Logging Into MXview One Remotely**.

## Logging Into MXview One Remotely

You can log in remotely to MXview One that is installed on your local site computer from another computer.

- Launch the MXview One server at the local site computer. Go to the tool bar and click the MXview One icon. Select **Remote Access**.

## NOTE

If the **Remote Access** function is enabled, you can access the MXview One Control Panel from another computer. To disable this function, click **Remote Access** again.

2. Open a web browser on the computer located at the remote site.
  3. In the address bar, input the IP address or domain name of the computer that you want to log in to MXview One from.
    - Format: **https://[IP address]:[Port]**
    - Example: **https://192.168.1.250:7100**
- The MXview One Control Panel appears.

4. Provide the following login credentials
  - **Username:** The default username is **admin**.
  - **Password:** The default password is **moxa**.
5. You can choose one of the actions listed below:
  - Click the Start button
  - Click the Stop button
  - Change the configurations on the Configuration page

6. To open the MXview One web console, you can type the IP address of the computer at the local site into another web browser once the MXview One Control Panel displays 'Service is running now'.
  - Format: **https://[IP address]**

- Example: `https://192.168.1.250`  
The MXview One web console appears.
- 7. Enter the login credentials and click **Log In**.
  - Default username: **admin**
  - Default password: **moxa**

8. When logging in using the default credentials, the **Change Password** screen will appear. Enter the old password and specify the new password.

The image shows the "Change Password" screen. At the top, the title "Change Password" is displayed in a green font. Below the title, there is a yellow warning box with a triangle icon and the text: "For security reasons, please change your password. It must be at least 8 characters, and include: One digit (0-9), Uppercase and lowercase letters, One special character (~!@#\$%^&\*~\_!;,:.<>[]{}()).". Below the warning box, there are three input fields: "Old Password \*", "New Password \*", and "Confirm New Password \*". Each field has a character count "0/63" to its right. At the bottom of the screen, there are two buttons: "Cancel" and "Change".

9. Click **Change**.  
The **Password Changed Successfully** screen will appear.

10. Click **Close** and log in with the updated password.

## NOTE

A maximum of 10 users can log in to MXview One web console at the same time.

# License Management

You can monitor your devices inside the networking status via MXview One. Please note, in order to monitor the devices, you need to activate the Node-based license. For example, if you activate 123 nodes in MXview One, then during the device discovery MXview One will only recognize up to 123 nodes. MXview One will stop the device discovery process once it reaches the 123-node limit.

To increase the node limit, you can purchase additional licenses and import the license into MXview One.

## NOTE

Click "Start Trial" to start using MXview One.

## Checking the License

The **License Management** screen displays information about your MXview One license, including the number of licensed nodes, nodes currently in use, and application license. You can also use the **License Management** screen to add a new license or deactivate an existing license.

To access the **License Management** screen, navigate to **Menu** (☰) > **Administration** > **License Management**.

MXview One activates the new license.

## NOTE

Please reference Chapter 4: **License Management** to get more details on how to get the activation code.

# Using Device Discovery

MXview One provides Device Discovery to help users quickly determine the network topology and handle basic configuration tasks.

1. To launch Device Discovery manually please do the following:

Navigate to **Menu** (☰) > **Device Discovery**.

**Device Discovery** appears to the right of the navigation panel.

2. Add the IP address ranges to scan for devices.

## NOTE

MXview One supports scanning multiple IP address ranges. The selected IP address scan ranges must be enabled in order for MXview One to scan for devices.

## NOTE

Moxa devices must have the SNMP function enabled for MXview One to scan the devices.

- a. Click the **Add** (+) icon.

The **Add Scan Range** screen appears.

- b. Select one of the following options:
  - ☐ **Enabled:** Select to enable scanning of the specified IP address range.
  - ☐ **Disabled:** Select to disable scanning of the specified IP address range.
- c. Configure the following:
  - ☐ Provide a custom display Name for the scan range.
  - ☐ Specify the **First IP Address** of the scan range.
  - ☐ Specify the **Last IP Address** of the scan range.
  - ☐ Select the **Subnet Mask** for the scan range (if applicable).
  - ☐ Select the MXview One **Group** to assign the scan range to.
  - ☐ Check the **Background Scanning** checkbox (if required). When enabled, MXview One will scan for compatible devices in the background and add them to the topology. An event log will be recorded when a device is added.
  - ☐ Check the **IP Conflict Detection** checkbox (if required). When enabled, MXview One will check for IP conflicts among field devices. This feature requires WinPcap/libpcap to be installed.
- d. Click **Add**.
- e. (Optional) Add additional network scan ranges, repeat the previous steps.
- f. (Optional) Modify scan range settings, click the **Edit** (✎) icon next to an added scan range.
- g. (Optional) Remove a scan range, click the **Delete** (🗑) icon next to the added scan range.
- h. Select one or more scan ranges to scan.
- i. Click **Next**.

MXview One scans the specified IP address ranges for devices.

| Enabled/Disabled                     | Name | First IP Address | Last IP Address | Group | Background Scanning | IP Conflict Detection |
|--------------------------------------|------|------------------|-----------------|-------|---------------------|-----------------------|
| <input type="checkbox"/> ✎ 🗑 Enabled | Test | 192.168.127.1    | 192.168.127.254 | Root  | Enabled             | Enabled               |

3. View devices discovered on the network.
  - a. MXview One displays discovered devices on the **Discovery Result** list. Scroll down to view more devices on the list.

**Device Discovery**

1 Network Range(s) 2 Discovery Result 3 Complete

| Device Alias                | Device IP | Group |
|-----------------------------|-----------|-------|
| Device discovery successful |           |       |

0 of 0

Next

- b. Click **Next**.
4. Click **Browse Topology** to view the detailed network topology.  
The **Topology** screen appears.

**Device Discovery**

Browse Topology

## NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices. However, you can draw the link of the topology manually by clicking **Add Link**.

# Account Management

To launch Account Management, please do the following: Navigate to **Menu** (☰) > **Account Management**.

The Account Management screen allows you to view, add, modify, and delete user accounts from MXview One. You can also export a list of user accounts and related information as a CSV file.

**Account Management**

User Account Password Policy Login Notification

All Users (4)  
Administrator (2)  
Supervisor (0)  
User (2)

|                          | Username | Authority     | Accessible Groups | Home Group |
|--------------------------|----------|---------------|-------------------|------------|
| <input type="checkbox"/> | user     | User          | Root              | Root       |
| <input type="checkbox"/> | guest    | User          | Root              | Root       |
| <input type="checkbox"/> | admin    | Administrator | Root              | Root       |
| <input type="checkbox"/> | emerald  | Administrator | Root              | Root       |

Items per page: 50 1 - 4 of 4

MXview One provides three default accounts:

- admin
- user
- guest

| Default Username | Default Password | Authority     |
|------------------|------------------|---------------|
| admin            | moxa             | Administrator |
| user             | moxa             | User          |
| guest            | moxa             | User          |

Each account can be assigned one of the following **Authority** permissions:

- **Administrator:** Has full access rights to modify any settings/configurations and can assign authorities to other accounts.
- **Supervisor:** Has full access rights to modify any settings/configurations on all pages apart from the **Account Management** page.
- **User:** Has the permissions listed below.

| Function          | Description                         |
|-------------------|-------------------------------------|
| Dashboard         | Read-only                           |
| Topology          | Read-only                           |
| Event History     | Can do some actions: Export, Filter |
| Syslog Viewer     | Can do some actions: Export, Filter |
| Inventory Report  | Can do some actions: Export         |
| About MXview One  | Can check the version               |
| User Manual       | Can link to the document            |
| API Documentation | Can link to the document            |

## Adding User Accounts

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.  
The **Account Management** screen appears.
2. Go to the **User Account** tab.
3. Click the **Add** (+) icon in the top-left corner of the screen.  
The **Add User Account** screen appears.

4. Configure the following account details:
  - **Username:** Specify the username for the account.
  - **Password:** Specify the login password (minimum length: 4 characters) for the account.
  - **Authority:** Assign the authority permission (Administrator, Supervisor, or User) for the account.
5. Click **Add**.

## Modifying User Accounts

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.

The **Account Management** screen appears.

2. Go to the **User Account** tab.
3. Click the **Edit** (✎) icon in front of the account you want to modify.

The **Modify User Account** screen appears.

**Modify User Account**

Username  
user  
4 / 32

Password \*  
0 / 63

User

Cancel Apply

4. Modify the following account details:
  - **Password:** Specify the login password (minimum length: 4 characters) for the account.
  - **Authority:** Assign the authority permission (Administrator, Supervisor, or User) for the account.
5. Click **Apply**.

## Editing Accessible Groups

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.  
The **Account Management** screen appears.
2. Go to the **User Account** tab.
3. Click the **Edit accessible groups** (👤) icon in front of the user account you want to modify the accessible groups and home group settings for.  
The **Edit Accessible Groups** window will appear.

**Edit Accessible Groups**

Username  
user  
4 / 32

Accessible Groups \*  
Root

Home Group \*  
Root

Cancel Save

4. Configure the following settings:
  - **Accessible Groups:** Select the device group(s) that this user account can access.
  - **Home Group:** Select the default device group(s) that show when this user account logs in.
5. Click **Save**.

## Deleting User Accounts

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.  
The **Account Management** screen appears.
2. Go to the **User Account** tab.
3. Click the **Delete** (🗑️) icon in front of the account you want to delete.
4. To delete multiple accounts, check the boxes of the accounts you want to delete and click the **Delete** (🗑️) icon in the top-left corner of the screen.  
MXview One deletes the account(s).

## Exporting User Accounts

The Account Management screen allows you to export a CSV file containing all user accounts with corresponding authority permissions and accessible sites.

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.  
The **Account Management** screen appears.
2. Go to the **User Account** tab.
3. Click the **Export** (📄) icon.

4. Select **Export CSV**.

## Configuring the Password Policy

Use the **Password Policy** screen to modify the password requirements for user accounts.

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.  
The **Account Management** screen appears.
2. Go to the **Password Policy** tab.

A screenshot of the 'Account Management' interface with the 'Password Policy' tab selected. The tab bar at the top has 'User Account', 'Password Policy' (which is highlighted with a green underline), and 'Login Notification'. The main content area is titled 'Account Management' and contains the following fields and options:

- A field for 'Minimum length (4 - 16) \*' with the value '4' entered.
- A section titled 'Password complexity strength check' with three checkboxes:
  - ☐ At least one digit (0-9)
  - ☐ Mixed upper and lower case letters (A-Z, a-z)
  - ☐ At least one special character (~!@#\$%^&\*-\_.,;<>[]{}())
- A green 'Save' button at the bottom.

3. Specify the minimum password length (between 4 to 16 characters).
4. Select one or more of the following password complexity requirements:

- **At least one digit (0~9)**
  - **Mixed upper and lower case letters (A~Z, a~z)**
  - **At least one special character (~!@#\$%^&\*-\_!;:,.<>[]{}())**
5. Click **Save**.  
MXview One requires all new account passwords to satisfy the modified password policy.

## Configuring Login Notifications

Use the **Login Notification** screen to customize the notifications displayed when users log in to MXview One.

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.  
The **Account Management** screen appears.
2. Go to the **Login Notification** tab.

The screenshot shows the 'Account Management' interface with three tabs: 'User Account', 'Password Policy', and 'Login Notification'. The 'Login Notification' tab is active. It contains a checkbox labeled 'Show Login Failure Records' which is checked. Below this are two text input fields: 'Login Message' and 'Login Authentication Failure Message'. Each field has a character count '0 / 250' and a small edit icon. At the bottom left is a green 'Save' button.

3. Check or uncheck the **Show Login Failure Records** box to enable or disable the login message and login failure records when logging in.
4. To display a custom login message, type a string (up to 250 characters in length) in the **Login Message** field.
5. To display a custom login authentication failure message, type a string (up to 250 characters in length) in the **Login Authentication Failure Message** field.
6. Click **Save**.  
MXview One displays the configured login notifications the next time a user logs in.

# Changing the Display Language

Use the **Language** icon screen to customize the notifications displayed when users log in to MXview One.

1. Navigate to **Language** (🌐).

The **Language** screen appears.

2. Select language.

3. MXview One supports the following languages:

- **German (Deutsch)**
- **Japanese (日本語)**
- **English**
- **Spanish (Español)**
- **French (Français)**
- **Simplified Chinese (简体中文)**
- **Traditional Chinese (繁體中文)**

4. Click **Save**.

MXview One updates the display language.

## 4. License Management

### License Management Overview

The **License Management** screen displays information about your MXview One license, including the license types, the number of licensed nodes, nodes currently in use, and the Add-on license. You can also use the **License Management** screen to add a new license or deactivate an existing license.

To access the **License Management** screen, navigate to **Menu** (☰) > **Administration** > **License Management**.

The screenshot displays the MXview ONE License Management interface. At the top, the header includes the MXview ONE logo and user information (English, admin). The main section is titled 'License Management' and contains a grid of license information. The grid includes a 'Node License' section with a document icon, showing 'Mode: Trial', 'Currently Used: 0', and 'Total Number of Licenses: 2000'. Below this, there are links for 'Moxa License Site' and 'Add New License'. The 'Deactivated licenses' section is expanded, showing a 'Trial Remaining' of 81 days. To the right of this, there are three license sections: 'Wireless Add-on License', 'Power Add-on License', and 'Security Add-on License', each with a 'Start to experience' message and a toggle switch. The 'Wireless Add-on License' toggle is 'Disabled', while the others are 'Enabled'. A 'Re-activate License' button is located at the bottom right of the deactivated licenses section.

| License Type            | Mode  | Currently Used | Total Number of Licenses |
|-------------------------|-------|----------------|--------------------------|
| Node License            | Trial | 0              | 2000                     |
| Wireless Add-on License | Trial |                |                          |
| Power Add-on License    | Trial |                |                          |
| Security Add-on License | Trial |                |                          |

Deactivated licenses

| License Type            | Status   | Action      |
|-------------------------|----------|-------------|
| Trial Remaining         | 81 days  |             |
| Wireless Add-on License | Disabled |             |
| Power Add-on License    | Enabled  |             |
| Security Add-on License | Enabled  |             |
| Re-activate License     |          | Re-activate |

# License Type

MXview One provides numerous types of licenses. Each license has a specific function.

|                         |                                                                             |
|-------------------------|-----------------------------------------------------------------------------|
| Trial License           | You can experience the power of MXview One for 90 days.                     |
| Node License            | Specifies the number of devices that MXview One can monitor in the network. |
| Wireless Add-on License | Allows users to access additional wireless related functions.               |
| Power Add-on License    | Allows users to access additional power related functions.                  |
| Security Add-on License | Allows users to access additional security related functions.               |

### License Type

**Trial License**

You can experience the power of MXview One for 90 days.

**Node License**

Specifies the number of the devices that MXview One can monitor in the network.

**Wireless Add-on License**

Allows users to access additional wireless related functions.

**Power Add-on License**

Allows users to access additional power related functions.

**Security Add-on License**

Allows users to access additional security related functions.

5. Open a web browser and go to <https://license.moxa.com/>. Select **MXview One** and log in to your Moxa account.
6. Click **Products and Licenses > Activate an add-on or renewal License**. Input a valid **Add-on Registration Code** and see if the Product Type behind the Registration Code has shown your license correctly.

Products and Licenses / Activate an add-on or renewal License

Add-on or Renewal Registration Code  Enter your Registration Code

Product type :

7. Paste a valid User code from MXview One. Then, click **Activate** to get the activation code.

The screenshot shows a web interface titled "Products and Licenses / Activate an add-on or renewal License". It contains three input fields: "Add-on or Renewal Registration Code" (with a greyed-out placeholder), "User code" (with the placeholder "Enter your user code"), and "License Type" (with a dropdown menu showing "ADD"). To the right of these fields, it says "Product type : MXview One Power". At the bottom right, there is a green "Activate" button.

8. Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been activated. Click **I know** to close the window. If the license failed to activate, enter the correct Registration Code and User code again. If you are still experiencing problems, please contact Moxa Support.

The screenshot shows a "Message notification" pop-up window. It contains the text: "Thank you for purchasing an MXview One product license! Your license has been activated, we will send you an activation notification to your mailbox." At the bottom, there is a green "I know" button.

9. Check the email account you used to apply for your moxa account. The activation code will be sent to this email address.

The screenshot shows an email notification. It starts with "Dear Customer," followed by "Your MXview One Activation Code" and a large greyed-out box containing the activation code. Below this, it says "has been activated successfully. Visit the [License Activation Portal](#) to see more details about your product and license activation code."

10. Copy the activation code from the email.

11. In MXview One, paste the activation code into the Activation Code field.

The 'Add New License' dialog box shows a three-step process: 1. Log in to the Moxa License Site, 2. Copy User Code, and 3. Activate. Step 3 is highlighted. Below the steps, it says 'Download the license from the [Moxa License Site](#), and paste the Activation Code here.' There is a text input field for the 'Activation Code'. At the bottom right are 'Close' and 'Apply' buttons.

12. Click **Apply** and MXview One will activate the license.

## Deactivating a License

If you want to transfer a license to a different instance of MXview One, the license has to be deactivated first.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.  
The **License Management** screen appears.
2. Expand the **Licenses** section.  
A list of activated licenses and activation codes appears.
3. Click **Deactivate** and MXview One will deactivate the license.

### NOTE

If you only have one Node-based License with one Add-on License, you will have to deactivate the Add-on License first, then deactivate the Node-based License next.

If you have more than one Node-based License, it is ok for you to deactivate the Node-based License or Add-on License without any order.

# Reactivating a Deactivated License

A deactivated license can be reactivated on the current instance of MXview One.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.  
The **License Management** screen appears.

2. Expand the **Deactivated Licenses** section.

A list of deactivated licenses and deactivation codes will appear.

3. Click **Re-activate** and then click **Next**.
4. Copy the deactivation code and click **Next**.

5. Open a web browser and go to <https://license.moxa.com>. Select **MXview One** and log in using your Moxa account.
6. Select **Products and Licenses** and click **Transfer a Product License**. Then, select **MXview One** from the product type list.

7. Paste the **Deactivation Code** followed by the **New User Code** from MXview One. Then, click **Product Transfer**.

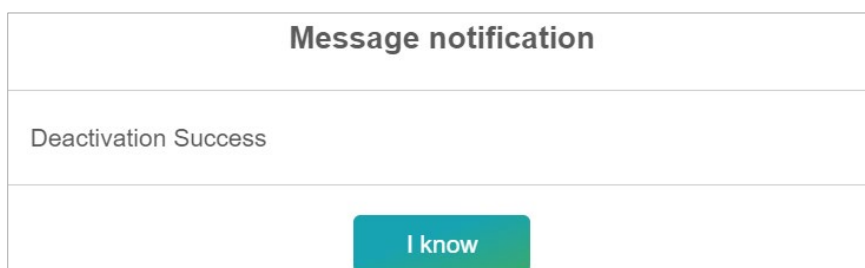

## NOTE

'Reactivating a Deactivated License' and 'Transfer a Deactivated License to another MXview One instance' are using the same menu here.

If you are implementing 'Reactivating a Deactivated License' on the current instance of MXview One, please paste the current MXview One User code in the 'New User Code' section.

8. Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been deactivated. Click **I know** to close the window. If the license failed to deactivate, enter the license key again. If you are still experiencing problems, please contact Moxa Support.

9. Check the email account you used to apply for your moxa account. The activation code will be sent to this email address.

10. Copy the activation code from the email.

11. In MXview One, paste the activation code into the Activation Code field.

The dialog box titled "Re-activate License" shows a four-step process: 1. Log In to the Moxa License Site, 2. Copy Deactivation Code, 3. Copy User Code, and 4. Activate. Step 4 is highlighted. Below the steps, it says "Download the license from the [Moxa License Site](#), and paste the Activation Code here." There is a text input field labeled "Activation Code". At the bottom right are "Close" and "Apply" buttons.

12. Click **Apply** and MXview One will reactivate the license.

## Transferring a License to a Different Instance of MXview One

A deactivated license can be transferred to a new instance of MXview One.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**. The **License Management** page will appear.
2. Expand the **Deactivated Licenses** section. A list of deactivated licenses and deactivation codes will appear. Copy the deactivation codes.

3. Open a web browser and go to <https://license.moxa.com>. Select **MXview One** and log in using your Moxa account.
4. Select **Products and Licenses** and click **Transfer a Product License**. Then, select **MXview One** from the product type list.

5. Paste the **Deactivation Code** and the **New User Code** from a new installation of MXview One. Then, click **Product Transfer**.

The screenshot shows a web interface titled "Products and Licenses / Transfer a Product License". It contains three input fields: "Product Type" with a dropdown menu showing "MXview One", "Deactivation Code" with a placeholder "Enter your deactivation code", and "New User Code" with a placeholder "Enter your New User Code". A green "Product Transfer" button is located at the bottom right of the form.

## NOTE

To obtain a new User Code, please visit "**Adding a New License**", and follow steps 1 to 4 to obtain and copy the new User Code.

6. Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been deactivated. Click **I know** to close the window. If the license failed to deactivate, enter the license key again. If you are still experiencing problems, please contact Moxa Support.

The screenshot shows a "Message notification" pop-up window. It has a title bar "Message notification" and a message area that says "Deactivation Success". At the bottom, there is a green button labeled "I know".

7. Check the email account you used to apply for your moxa account. The activation code will be sent to this email address.

The screenshot shows an email from Moxa. The header features the Moxa logo. The body of the email starts with "Dear Customer," followed by "Your New MXview One Activation Code" and a long, masked activation code. The email concludes with the text: "ed successfully. You can now start using MXview on this system. Visit the [License Activation Portal](#) to see more details about your product and license activation code."

8. Copy the activation code from the email.

9. In MXview One, paste the activation code into the Activation Code field.

### Re-activate License

1

Log In to the Moxa License Site

2

Copy Deactivation Code

3

Copy User Code

4

Activate

Download the license from the [Moxa License Site](#), and paste the Activation Code here.

Activation Code

Close

Apply

10. Click **Apply** and MXview One will reactivate the license.

## Quantity of Monitored Devices Exceeds the Number of Node-based Licenses

When the quantity of monitored devices exceeds the activated number of license nodes, you can purchase additional Node-based Licenses and activate them as required. Or you can delete the extra devices that you don't have to monitor.

### License Management

#### MXview One

##### License

#### Re-activate License

Use both the Deactivation Code and a User Code to re-activate your license.

### 1. Buy Extra Node-based Licenses

Order the required quantity of Node-based Licenses from your channel or Moxa Sales Representative. Then, follow the instructions on **Adding a New License** to activate a new license.

### 2. Delete Extra Devices

- a. You can delete the devices on the **Topology** page to meet the number of Node-based Licenses you available.

b. Please follow the instructions below:

- ☐ Press the **Stop** button in the Control Panel.

- ☐ After 1 minute, Click **Start** and wait for the status to display 'Service is running now'. Then, click **Open MXview One** and Log in to MXview One.
- ☐ Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and displays the Topology Map by default.
- ☐ Click the devices you want to delete and then click **Delete**. From now on, MXview One will not count the delete devices.

## 5. Dashboard Widgets

The MXview One **Dashboard** contains several widgets that provide summary information about your network devices and event highlights.

### Dashboard Overview

To access the Dashboard, navigate to **Menu** (☰) > **Dashboard**.

Use the **Dashboard** to gain a quick overview of your network devices, important system events.

The **Dashboard** displays the following widgets:

- Device Summary
- Event Highlights: Cold/Warm Start Trap
- Event Highlights: ICMP Unreachable
- Event Highlights: Link Down

To refresh the data displayed in all the widgets, click the **Settings** (⚙️) icon in the top right corner of the screen and select **Refresh All**.

### Device Summary

The **Device Summary** widget displays the following information about the devices on your network:

- **Healthy Devices:** The number of devices with no critical events or warnings.  
Click to view additional details about the devices on the **Topology** screen.
- **Warning Devices:** The number of devices with warnings.  
Click to view additional details about the devices on the **Topology** screen.
- **Critical Devices:** The number of devices with critical events.  
Click to view additional details about the devices on the **Topology** screen.

# Event Highlights

The Event Highlights will display the following events during the past seven days: Cold/Warm Start Trap, ICMP Unreachable, and Link Down.

**Event Highlights:** The **Cold/Warm Start Trap** widget displays the number of cold start traps and warm start traps issued by devices at a site, and the day on which the events occurred.

**Event Highlights:** The **ICMP Unreachable** widget displays the number of times an ICMP-enabled device on your network was unreachable, and the day on which the events occurred.

**Event Highlights:** The **Link Down** widget displays the number of times a port link was down on a device on a specific date.

You can perform the following actions on this widget:

- To view the number of event highlights issued at a site on a specific date, hover over a bar in the widget chart.
- To view additional details about the event on the **Event History** screen, click a bar on the widget chart.
- To refresh the widget data, click the **Refresh** (🔄) button following the **Last Update** timestamp.
- To download the Event Highlights data, click (☰) below the Refresh button.

## 6. Device Discovery and Polling

### Device Discovery Overview

MXview One uses SNMP, ICMP, and MMS to discover devices within the scan ranges. When a Moxa device has been located, MXview One will generate an actual image of the device, demonstrated below, to indicate the device's location on the network.

MXview One will also list detailed properties and configuration parameters, including the following:

- MAC Address
- Model Name
- IP Address
- Netmask
- Gateway
- Trap Server Address
- Auto IP Configuration
- Type of Redundancy Protocol
- Role in Redundancy Protocol
- Status and Properties of the Port
- Power Status
- Status and Version of the SNMP Protocol

MXview One will display one of the following graphics to indicate devices:

| Device                              | Image                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------|
| Moxa devices with SNMP enabled.     |  |
| Non-Moxa devices with SNMP enabled. |  |
| Non-Moxa devices with ICMP enabled. |  |
| Non-Moxa devices with MMS enabled.  |  |

# Configuring IP Address Scan Ranges

MXview One allows you to scan multiple ranges of IP addresses within your network. Each network range is defined by a starting IP address and an ending IP address. Use **Device Discovery** to configure network scan ranges.

1. Access the **Device Discovery** screen by the following method:
  - a. Navigate to **Menu** (☰) > **Device Discovery**.
  - b. Navigate to **Menu** (☰) > **Topology**, and then navigate to **Topology** > **Device Discovery** from the Topology toolbar menu.

The **Device Discovery** screen will appear.

2. To add a new scan range:
  - a. Click the **Add** (+) button in the top left corner.The **Add Scan Range** screen will appear.

- b. Select the scan range status:
    - ☐ **Enabled**
    - ☐ **Disabled**
  - c. Provide a **Name** for the scan range.
  - d. Provide the starting IP address for the scan range.
  - e. Provide the ending IP address for the scan range.
  - f. Select the **Subnet Mask** (if applicable).
  - g. Assign the scan range to a **Group**.
  - h. Check the **Background Scanning** checkbox (if required). When enabled, MXview One will scan for compatible devices in the background and add them to the topology. An event log will be recorded when a device is added.
  - i. Check the **IP Conflict Detection** checkbox (if required). When enabled, MXview One will check for IP conflicts among field devices. This feature requires WinPcap/libpcap to be installed.
  - j. Click **Add**.  
The new scan range appears in the Network Range table.
3. To edit a scan range:
  - a. Select the check box next to the scan range in the **Network Range** table.
  - b. Click the **Edit** (✎) icon.  
The **Edit Scan Range** screen appears.
  - c. Modify the scan range settings.
  - d. Click **Apply**.  
The **Device Discovery** screen displays the **Network Range** table with the updated scan range information.
4. Click **Next** to discover the devices within the specific IP address ranges.

- To complete scan range configuration, click **Next**.  
The **Complete** tab and the number of devices added to MXview One.

- To view the updated topology, click **Browse Topology**.  
The **Topology** screen will appear and display the updated Topology Map.

## Configuring Device Polling Settings

Devices in the assigned scan range can be discovered via SNMP and ICMP protocols. (The default polling interval of ICMP is 10 seconds, while SNMP is 60 seconds. Users can go to the **Default Device Template** page to change the polling intervals.) After a device is discovered, MXview One will use SNMP and ICMP to poll the device periodically. To configure this function properly, you will need to know the following information:

### NOTE

MXview One **Dashboard** widgets also use the device polling settings. For more information about the MXview One **Dashboard** widgets, see Chapter 5: **Dashboard Overview**.

- Navigate to **Menu** (☰) > **Administration** > **Default Device Template**.  
The **Default Device Template** screen appears.
- Scroll down to the **MXview One Polling Interval** section.

- Configure the following ICMP polling settings:  
**ICMP polling interval:** Specify the time in seconds between polls. MXview One will use ICMP protocol to check if the device is alive.
- Configure the following SNMP polling settings:  
**SNMP polling interval:** Specify the time in seconds between polls.
- Scroll down to the **Log In** section to configure the device web console login credentials:
  - **Username:** The login username for the device web console
  - **Password:** The login password for the device web console

A screenshot of a 'Log In' form. The title 'Log In' is in blue. Below it, the label 'Username \*' is followed by a text input field containing the text 'admin'. Below that, the label 'Password \*' is followed by a text input field containing four dots '....'. To the right of the password field is a small icon of an eye with a diagonal line through it, indicating a toggle for password visibility. The entire form is enclosed in a thin black border.

6. Click **Save**.  
MXview One will update the modified settings.

# Changing the Default SNMP Configuration

The default SNMP read community string that is used to discover devices is public. Use the **Default Device Template** screen to change the default read community string or modify other default SNMP configuration.

1. Navigate to **Menu** (☰) > **Administration** > **Default Device Template**.

The **Default Device Template** screen will appear.

2. Scroll down to the **SNMP Configuration** section.

The screenshot shows the 'SNMP Configuration' section of the 'Default Device Template' screen. It contains the following fields and options:

- SNMP Version \***: A dropdown menu currently set to 'V1'.
- Port \***: A text field containing '161'.
- Username**: A text field containing 'admin'.
- Password**: A text field (currently empty).
- Read Community**: A text field containing 'public'.
- Write Community**: A text field containing 'private'.
- Data Encryption**: A dropdown menu currently set to 'NoAuth'.
- Authentication**: A dropdown menu currently set to 'MD5'.
- Encryption Protocol**: A dropdown menu currently set to 'DES'.
- Encryption Password**: A text field (currently empty).

3. Configure the following settings:
  - a. **SNMP Version:** Select the SNMP protocol version
  - b. **SNMP Port:** Specify the SNMP port
  - c. **Username:** Specify the SNMP server username
  - d. **Password:** Specify the SNMP server password
  - e. **Read Community:** Specify the new community string
  - f. **Write Community:** Specify the new community string
  - g. **Data Encryption:** Select the data encryption method
    - ☐ NoAuth
    - ☐ AuthNoPriv
    - ☐ AuthPriv
  - h. **Authentication:** Select the authentication method
    - ☐ MD5
    - ☐ SHA
    - ☐ SHA256
    - ☐ SHA512
  - i. **Encryption Protocol:** Select the encryption protocol and input the Encryption Password.
    - ☐ DES
    - ☐ AES
4. Click **Save**.

MXview One updates the modified settings.

# Changing Modbus TCP Settings

By configuring Modbus TCP Settings in the Default Device Template section, MXview One will be able to detect whether a device has Modbus attributes or not. If a device supports Modbus, a Modbus string will appear above the device icon in the topology to easily identify the device.

1. Navigate to **Menu** (☰) > **Administration** > **Default Device Template**.  
The **Default Device Template** screen will appear.
2. Scroll down to the **Device Identification Settings** section.

| Device Identification Settings |                        |                        |
|--------------------------------|------------------------|------------------------|
| Modbus Enable *                | Modbus Port *          |                        |
| Disabled                       | 502                    |                        |
|                                | 1 - 65535              |                        |
| EtherNet/IP Enable *           | EtherNet/IP TCP Port * | EtherNet/IP UDP Port * |
| Disabled                       | 44818                  | 44818                  |
|                                | 1 - 65535              | 1 - 65535              |
| Siemens S7comm Enable *        | Siemens S7comm Port *  |                        |
| Disabled                       | 102                    |                        |
|                                | 1 - 65535              |                        |

3. Configure the following settings:
  - a. **Modbus Enabled:** Enable or disable Modbus TCP settings.
  - b. **Modbus Port:** Specify the Modbus TCP port.
4. Click **Save**.  
MXview One updates the modified settings.

# Changing EtherNet/IP Settings

By configuring EtherNet/IP Settings in the Default Device Template section, MXview One will be able to detect whether an ICMP device has EtherNet/IP attributes or not. If an ICMP device supports EtherNet/IP, an EtherNet/IP device icon will be displayed in the topology to easily identify the device.

1. Navigate to **Menu** (☰) > **Administration** > **Default Device Template**.  
The **Default Device Template** screen will appear.
2. Scroll down to the **Device Identification Settings** section.

| Device Identification Settings |                        |                        |
|--------------------------------|------------------------|------------------------|
| Modbus Enable *                | Modbus Port *          |                        |
| Disabled                       | 502                    |                        |
|                                | 1 - 65535              |                        |
| EtherNet/IP Enable *           | EtherNet/IP TCP Port * | EtherNet/IP UDP Port * |
| Disabled                       | 44818                  | 44818                  |
|                                | 1 - 65535              | 1 - 65535              |
| Siemens S7comm Enable *        | Siemens S7comm Port *  |                        |
| Disabled                       | 102                    |                        |
|                                | 1 - 65535              |                        |

3. Configure the following settings:
  - **EtherNet/IP Enable:** Enable or disable EtherNet/IP settings.
  - **EtherNet/IP TCP Port:** Specify the EtherNet/IP TCP port.
  - **EtherNet/IP UDP Port:** Specify the EtherNet/IP UDP port.
  - Click **Save**.  
MXview One updates the modified settings.

# Changing Siemens S7comm Settings

By configuring Siemens S7comm Settings in the Default Device Template section, MXview One will be able to detect whether an ICMP device has Siemens S7comm attributes or not. If an ICMP device supports Siemens S7comm, a Siemens S7comm device icon will be displayed in the topology to easily identify the device.

1. Navigate to **Menu (☰) > Administration > Default Device Template.**

The **Default Device Template** screen will appear.

2. Scroll down to the **Device Identification Settings** section.

| Device Identification Settings |                        |                        |
|--------------------------------|------------------------|------------------------|
| Modbus Enable *                | Modbus Port *          |                        |
| Disabled                       | 502                    |                        |
|                                | 1 - 65535              |                        |
| EtherNet/IP Enable *           | EtherNet/IP TCP Port * | EtherNet/IP UDP Port * |
| Disabled                       | 44818                  | 44818                  |
|                                | 1 - 65535              | 1 - 65535              |
| Siemens S7comm Enable *        | Siemens S7comm Port *  |                        |
| Disabled                       | 102                    |                        |
|                                | 1 - 65535              |                        |

3. Configure the following settings:
  - **Siemens S7comm Enable:** Enable or disable Siemens S7comm settings.
  - **Siemens S7comm Port:** Specify the Siemens S7comm port.
4. Click **Save**.  
MXview One updates the modified settings.

# 7. Topology Management

MXview One allows you to view a graphical representation of your network topology, add/delete devices and links to the Topology Map, organize the topology structure, and export the Topology Map as a PNG image. You can also scan specific IP address ranges to discover devices on your network.

## Topology Overview

The Topology screen allows you to view the Topology Map, which is a graphical representation of the devices in your network, and perform most actions in MXview One. For example, you can use the Network Topology screen to do the following:

- Display a graphical representation of a real network.
- Show connecting relationships between devices.
- Indicate the status of devices and links.

# Viewing the Topology Map

Use the Topology screen to view the Topology Map of your network.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and displays the Topology Map by default.

2. If the **List view** is displayed, click the **Topology view** (🗺️) icon in the top right corner.

The Topology screen will display a graphical representation of the devices and links on your network.

3. To search for a specific device on the Topology Map:

- a. Click the **Search topology** (🔍) icon in the top left corner.

The topology search box appears with a drop-down directory tree of the Topology Map structure.

- b. Search the device in the drop-down directory tree or type a string in the search box. Click the specific device and MXview One will bring you to the device on the Topology Map.

4. To view the details of a specific device, select the device in the Topology Map.

The **Device Properties** pane appears to the right of the Topology Map.

- To view events associated with the device, click the **Current Status**.  
The **Current Status** pane displays events associated with the device.

- To view details about a link between devices, select a link in your Topology Map.

The **Link Properties** pane appears to the right of the Topology Map.

# Viewing Recent Events

Use the **Topology** screen to view recent events from devices in your topology. You can filter the events in the list or export the data as a CSV file.

For more information on viewing all events, see [Event Monitoring](#).

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and displays the **Recent Events** panel on the bottom.

| Site Name           | ID   | Source     | Source IP       | Device Alias              | Description             | Time Issued         |
|---------------------|------|------------|-----------------|---------------------------|-------------------------|---------------------|

2. To filter the information in the table, type a full or partial string that matches the value in any of the table columns on the right of the search space.  
MXview One filters the table to only display events with values that fully or partially match the specified string.
3. To filter the information in the table by specific criteria:
  - a. Click the **Filter** (≡) icon below the **Recent Events** tab.  
The criteria selection screen appears.

Filter

Severity Source Group IP Address

Reset Apply

- b. Specify any of the following criteria:
  - ☐ **Severity:** Select the event severity level
    - Any
    - Information
    - Warning
    - Critical
    - System Information

- ☐ **Source:** Select the source that detected the event
    - Any
    - MXview One
    - Trap
  - ☐ **Group:** Select the device group
  - ☐ **IP Address:** Select the device IP address
- c. Click **Apply**.  
MXview One filters the table to only display events that match the specified criteria.
4. To acknowledge the events in the table:
- a. Click the Acknowledge (☑) icon before the specific event, then the event will be confirmed.
  - b. If you want to acknowledge more events, click the checkbox before the events or click the checkbox on the tool bar to select all the events. Then, click the Acknowledge icon.
5. To sort the data in the table by a specific column, click the column heading.  
MXview One sorts the table by the column.

| ID | Source     | Source IP       | Device Alias             |
|----|------------|-----------------|--------------------------|
| 43 | MXview One | 192.168.127.252 | 192.168.127.252-EDS-505A |

6. To export data displayed in the **Recent Events** tab:

- a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.
- c. Specify the location to save the exported file.
- d. Click **Save**.

MXview One exports the displayed event data as a CSV file.

7. To quickly filter event, click the **Quick filter event** (☰) icon to find the events.

The events include the following:

- Unacknowledged Events
- Last 20 Unacknowledged Events
- Last 20 Events
- Last 50 Events.

8. MXview One allows users to display the Recent Events panel all the time by clicking the **Always show "Recent Events" at the startup** checkbox.

## Organizing the Topology Structure By Group Function

The Topology Map can be organized into a multi-layer tree structure of up to 5 layers. Organizing the topology structure into groups helps manage a large number of nodes on the computer screen. For example, users can move nodes of the same subnet or location into the same group. Root, which is the only group at the first layer, exists by default and cannot be deleted. Groups created by users are in the layer under Root. Devices can be moved between groups.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

- MXview One represents the Topology Map structure by a path at the top of the **Topology** screen:

- If the Topology Map contains groups under the Root layer, you can click the right arrow (>) and select the group:

- You can also click the following icon used to indicate user-defined groups within the Topology Map:

2. If **List view** is displayed, click the **Topology view** (👤) icon in the top right corner.

The **Topology** screen displays the following toolbar above the Topology Map:

3. To create a group:
  - a. Navigate to **Group > Create Group**.  
The **Create Group** screen appears.

The **Create Group** screen is shown. It has a title bar with the text "Create Group". Below the title bar, there are four input fields: "Parent Group \*" with a dropdown menu showing "Root", "Group Name \*" with the text "group1", "Group Description" with the text "Test", and "Image" with a placeholder icon. The "Image" field has a note "The maximum image size is 1 MB". At the bottom right, there are two buttons: "Cancel" and "Create".

- b. Configure the following:
      - ☐ Parent Group
      - ☐ Group Name
      - ☐ Group Description
      - ☐ Group Icon
    - c. Click **Create**.  
MXview One will add the group below to the specified parent group.
  4. To reorganize the groups within the Topology Map structure:
    - a. Navigate to **Group > Group Maintenance**.  
The **Group Maintenance** screen appears.

The **Group Maintenance** screen is shown. It has a title bar with the text "Group Maintenance". Below the title bar, there are two icons: a plus sign and a trash can. Below the icons, there is a tree view showing a hierarchy: "Root" (expanded) and "group 1" (indented). At the bottom right, there are two buttons: "Cancel" and "Apply".

- b. Select a layer to modify.

The group details appear to the right of the topology directory tree.

The 'Group Maintenance' dialog box is shown. On the left, under 'Root', 'group 1' is selected. On the right, the 'Group Name \*' field contains 'group 1' (7 / 63 characters). The 'Group Description' field is empty (0 / 128 characters). Below the description is an 'Image' section with a plus icon, a trash icon, and a network diagram icon. A note states 'The maximum image size is 1MB'. At the bottom right are 'Cancel' and 'Apply' buttons.

- c. (Optional) Edit the group details or perform one of the following points:
- (Optional) Click **Add** to add a new group below the selected layer.
  - (Optional) Click **Delete** to remove a group from the topology structure.
- d. Click **Apply**.
5. To reassign the device(s) in a group:
- There are two ways to reassign the device(s) in a group:
    - Navigate to Group > **Change Group**. The Change Group screen appears.
    - Select the device(s) you want to reassign on the topology and click the Change Group icon on the toolbar.

The 'Change Group' dialog box is shown. At the top, 'Current Group \*' is set to 'Root'. Below is a list of IP addresses with checkboxes: 192.168.127.154, 192.168.127.155, 192.168.127.156, 192.168.127.157, 192.168.127.158, 192.168.127.159, 192.168.127.160, 192.168.127.161, and 192.168.127.162. Below the list, it says '0 Selected / 50 total'. At the bottom, 'Assign to Group \*' is set to 'group 1'. There are 'Cancel' and 'Apply' buttons at the bottom right.

- If the **IP Address** list does not display the IP address(es) of the device(s) you want to reassign, select the **Current Group** drop-down list.
- Select the IP address(es) of the device(s) that you want to reassign to a different group.
- From the **Assign to Group** drop-down list, select the new group for the selected device(s).
- Click **Apply**.

## Redundant Topologies

Redundant topologies have at least one backup link, which will be indicated with a dashed line:

For devices that play a particular role in the topology, MXview One will label the devices by displaying the roles above the images of the devices. Backup links will be indicated with dashed lines.

- RSTP has a **Root**
- Turbo Ring has a **Master**
- Turbo Chain has a **Head** and a **Tail**
- Dual Homing

### NOTE

Only the **Auto Topology** function can draw dashed lines for redundancy links. Redundant links that are added manually will appear as solid lines.

## PoE Power Consumption Visualization

By periodic polling, a PoE link will display the port number, power (watts), voltage (V), and current (mA) directly on the topology map.

# VPN Tunnel Visualization

The VPN tunnel link will display 'VPN' on the link.

1. The VPN tunnel is connected.

2. The VPN tunnel is disconnected.

## NOTE

VPN Tunnel Visualization is only available on Moxa's EDR-810 and EDR-G9010 series of secure routers.

# Port Trunking

Port trunking, also called link aggregation, involves grouping links into a link aggregation group. Trunking links will be indicated with thick, solid lines.

## NOTE

Only **Auto Topology** can draw thick lines for trunking links. Trunking links that are added manually will appear as solid lines.

## NOTE

For trunked link, check **Device Properties** to get the port number corresponding to the trunking information.

# Adding Devices and Links

MXview One allows you to manually add devices and links to an automatically generated Topology Map. The **Topology** screen allows you to add devices from Topology View or List View.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. To add a device to the Topology Map:

- a. Click **Edit > Add Device**.

The **Add Device** screen will appear.

The screenshot shows the 'Add Device' form with the following fields and values:

| Field               | Value   |
|---------------------|---------|
| IP Address *        |         |
| Assign Model *      |         |
| Assign to Group *   |         |
| SNMP Version *      | V1      |
| Port *              | 161     |
| Username            | admin   |
| Password            |         |
| Read Community      | public  |
| Write Community     | private |
| Data Encryption     | NoAuth  |
| Authentication      | MD5     |
| Encryption Protocol | DES     |
| Encryption Password |         |

Buttons: Cancel, Add

- b. Configure the following:

- ☐ **IP Address:** Specify the IP address of the device
- ☐ **Assign Model:** Select the model of the device
- ☐ **Assign to Group:** Select the group to assign the device to
- ☐ **SNMP Version:** Select the SNMP version
- ☐ **Port:** Specify the port number
- ☐ **Username:** Specify the device login Username
- ☐ **Password:** Specify the password
- ☐ **Read Community:** Specify the SNMP read community string
- ☐ **Write Community:** Specify the SNMP write community string
- ☐ **Data Encryption:** Select the data encryption method
- ☐ **Authentication:** Select the authentication method
- ☐ **Encryption Protocol:** Select the encryption protocol and input the **Encryption Password**

- c. Click **Add**.

MXview One adds the device to the topology.

3. To add a link to the Topology Map:
  - a. Navigate to **Edit > Add Link**.  
The **Add Link** screen will appear.

- b. Configure the following information for the two devices joined by the link:
    - ☐ **Device:** Specify the IP address of the device
    - ☐ **Port:** Specify the device port number
  - c. Click **Add**.  
MXview One adds the link between the specified devices.

## NOTE

Links drawn between two devices in the Topology Map are bidirectional. You may specify either device as the **From** device or the **To** device.

## NOTE

Trunking and redundancy links added manually will appear as solid lines.

## NOTE

Port numbers must be numeric and entered correctly to obtain the correct traffic information.

## NOTE

For modular switches, a port number depends on the chassis to which the port belongs, but not on how many modules are inserted. For switches such as the PT-7828, the first module's port numbers are from 1 to 8, the second module's port numbers are from 9 to 16, and so on. The port number depends only on which slot the module is in; in other words, the port number is the same regardless of whether other slots are empty or occupied.

# Deleting Devices and Links

You can delete devices and links from the Topology Map. After a device is deleted, it will be removed from the topology map, and the device will not be polled or located when performing Device Discovery. Deleting a link will delete a link from the topology map, but it will not affect the actual network configuration.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. To delete a device from the Topology Map:
  - a. Select the device.

The following toolbar menu will appear.

- b. Click **Delete**.

A confirmation screen will appear.

- c. Click **Delete**.

MXview One deletes the device from the Topology Map.

3. To delete a link from the Topology Map:

- a. Select the link.

The following toolbar menu will appear.

- b. Click **Delete**.

A confirmation screen will appear.

- c. Click **Delete**.

MXview One deletes the link from the Topology Map.

## Updating the Topology Map

Updating the existing topology adds new links and updates existing links, but does not change the status of links that are indicated as having been disconnected or links that were drawn manually.

For devices with LLDP functionality, MXview One can draw the physical topology map, down to the port level of the devices. For devices without an LLDP MIB, MXview One is able to draw links by using ARP. To activate this function, select the **Advanced Topology Analysis** checkbox from the **Auto Topology** screen.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. If **List view** is selected, click the **Topology view** (🔗) icon in the top right corner.

The **Topology** screen displays a graphical representation of the devices and links on your network.

3. Navigate to **Topology > Auto Topology**.

The **Auto Topology** screen appears.

**Auto Topology**

☐ New Topology

Existing links are going to be deleted

☒ Update Topology

Existing links will be kept while new links are added

☒ Advanced Topology Analysis ⓘ

☐ Strict Link Verification Mode ⓘ

\*Additional time is required.

Cancel Apply

4. Select **Update Topology**.
  5. (Optional) Select **Advanced Topology Analysis** to draw links for devices without an LLDP MIB.
  6. (Optional) Select **Strict Link Verification Mode**. If enabled, links between devices will only be shown on the topology if the devices on both ends have the other device's information in their LLDP table.
  7. Click **Apply**.
- MXview One will update the Topology Map.

## NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices. However, you can draw the link of the topology manually by clicking **Add Link**.

## NOTE

You can create an Auto Topology scheduled task from the **Menu > Administration > Maintenance Scheduler** page.

# Refreshing the Topology Layout

After changes have been made, use the **Auto Layout** feature to refresh the layout of the Topology Map. Auto Layout does not update any devices or links. It only redraws the topology to better fit the screen.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and displays the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.  
The **Topology** screen will display a graphical representation of the devices and links on your network.
3. Navigate to **Topology > Auto Layout**.  
The **Auto Layout** screen appears.

**Auto Layout**

Are you sure you want to use Auto Layout?  
(current layout will be overridden)

Cancel Apply

4. Click **Apply**.

MXview One refreshes the Topology Map layout.

## Creating a New Topology Map

Creating a new topology deletes all links, requests LLDP information from devices, and draws topology maps based on the gathered information.

For devices with LLDP functionality, MXview One can draw the physical topology map, down to the port level of the devices. For devices without an LLDP MIB, MXview One is able to draw links by using ARP. To activate this function, select the **Advanced Topology Analysis** checkbox from the **Auto Topology** screen.

### NOTE

Links drawn manually will also be deleted by this action.

### NOTE

Your devices must have firmware version 3.1 or higher to use **Advanced Topology Analysis**.

### NOTE

If the Auto Topology function does not create an accurate representation of the actual network, deselect the **Advanced Topology Analysis** check box and try again.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and displays the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🌐) icon in the top right corner.  
The **Topology** screen displays a graphical representation of the devices and links on your network.
3. Navigate to **Topology** > **Auto Topology**.  
The **Auto Topology** screen appears.

**Auto Topology**

☒ New Topology

Existing links are going to be deleted

☐ Update Topology

Existing links will be kept while new links are added

☒ Advanced Topology Analysis ⓘ

☐ Strict Link Verification Mode ⓘ

\*Additional time is required.

Cancel Apply

4. Select **New Topology**.
5. (Optional) Select **Advanced Topology Analysis** to draw links for devices without an LLDP MIB.
6. Click **Apply**.  
MXview One will create a new Topology Map.

## NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices. However, you can draw the link of the topology manually by clicking **Add Link**.

# Setting/Editing the Background Image

MXview One allows you to customize the Topology Map by uploading a background image in JPG, GIF, or PNG format.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and will display the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🌐) icon in the top right corner.  
The **Topology** screen will display a graphical representation of the devices and links on your network.
3. Navigate to **Edit > Background**.  
The **Background** screen appears.

4. Upload the background image by using one of the following methods:
  - The image size must be less than 20 MB.
  - Click **Set Background** (📎) icon to upload the image file.MXview One will set the uploaded image as the Topology Map background.
5. Use the sliders to modify the **Alpha** and **Saturation** value of a background image.

- Under the **Position** section, modify the value of X and Y to move the origin of the image to a suitable location. Modify the 'Width' and 'Height' to change the size of the image.

- To delete a background image, click (🗑️) to remove the background image from the Topology Map.

## Editing the Topology Appearance

Use the **Preferences** screen to modify how the Topology Map displays the topology line style, PoE status, background color, link status, and traffic load.

- Navigate to **Menu** (☰) > **Administration** > **Preferences**.  
The **Preferences** screen appears.
- In the **Appearance** section, expand **Topology**.  
The **Topology** settings appear.

3. To modify the Topology Line Style, select one of the following from the drop-down list:

➤ **Directed Line Style**

MXview One applies the following style to the lines indicating the links between devices in the Topology Map:

Directed Line Style

➤ **Elbow Line Style**

MXview One applies the following style to the lines indicating the links between devices in the Topology Map:

Elbow Line Style

4. To modify the text size in MXview One:  
Select one of the following from the drop-down list:

- Large
- Medium
- Small

5. To modify how MXview One displays Power-over-Ethernet (PoE) links:
  - a. Select the **Show PoE Status on Topology** check box to indicate the PoE link status on the Topology Map.

**PoE**

☒ Show PoE Status on Topology

PoE Link Color  #CECECE

- b. Click the **PoE Link Color** field and specify a new color.

**PoE**

☒ Show PoE Status on Topology

PoE Link Color  #CECECE

**Background**

Background Color  #FFFFFF

**Status Color**

Link Up  #CECECE

Link Down  #FF0000

| <input type="color"/> #CECECE | <input type="color"/> #CECECE |
| Multiple Network Coupling     | MRP                           |
| <input type="color"/> #123456 | <input type="color"/> #000000 |
| MRP Interconnect              |                               |
| <input type="color"/> #CECECE |                               |

## NOTE

The three status colors (**PRP LAN A**, **PRP LAN B**, **HSR Ring**) will appear when you activate the MXview Power license.

8. Click **Save**.
- MXview One will update the modified settings.

# Editing the Device Appearance

Use the **Preferences** screen to modify how devices appear in the Topology Map.

1. Navigate to **Menu** (☰) > **Administration** > **Preferences**.

The **Preferences** screen will appear.

2. In the **Appearance** section, expand **Device**.

The **Device** settings will appear.

The screenshot shows the 'Appearance' section of the MXview One Preferences screen. The 'Device' section is expanded, showing a 'Preview' image of a server rack. Below the preview is a 'Bottom Label' dropdown menu currently set to 'None'. A yellow warning box contains the text: 'If you change the Alias setting, please delete the device on the topology and then rescan or add a device to complete the 'Alias' setting.' Below the warning box, there are two 'Bottom Label' dropdown menus separated by a plus sign. The first is labeled 'Alias' and is set to 'IP Address'. The second is labeled 'Bottom Label' and is set to 'Model Name'.

3. To modify the label that indicates the device in the Topology Map:
  - a. Locate the **Bottom Label** drop-down list located below the Preview image:

This is a close-up screenshot of the 'Device' section from the previous image. It shows the 'Preview' image of the server rack, the 'Bottom Label' dropdown menu set to 'None', and the yellow warning box with the text: 'If you change the Alias setting, please delete the device on the topology and then rescan or add a device to complete the 'Alias' setting.'

- b. Select one of the following properties from the **Bottom Label** drop-down:

- ☐ Location
- ☐ Alias
- ☐ Model Name
- ☐ MAC

MXview One displays the selected property below the IP address of the device.

4. To modify the device alias:
- a. Locate the **Alias** section.

- b. From the first drop-down list in the Alias section, select one of the following:
- ☐ IP Address
  - ☐ MAC
  - ☐ Model Name
  - ☐ Location
  - ☐ SysName
- c. From the second drop-down list in the Alias section, select one of the following:
- ☐ IP Address
  - ☐ MAC
  - ☐ Model Name
  - ☐ Location
  - ☐ SysName

## NOTE

If you change the Alias setting, please delete the device on the topology and then rescan or add a device to complete the 'Alias' setting.

5. Click **Save**.
- MXview One updates the modified settings.

# Exporting the Topology Map

MXview One allows you to export the Topology Map as a PNG image.

1. Navigate to **Menu** () > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. If **List view** is selected, click the **Topology view** () icon in the top right corner.

The **Topology** screen will display a graphical representation of the devices and links on your network.

3. Navigate to **Edit** > **Export Topology**.

MXview One exports the PNG image of the Topology Map.

## 8. Network and Traffic Monitoring

MXview One allows you to monitor the traffic between devices on your network and trigger events for specific traffic conditions. You can apply topology views to monitor traffic load, network security, as well as wireless access points and clients.

### Viewing Link Properties

Click a link on the Topology Map to view link properties and perform the following:

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane appears to the right of the Topology Map.

# Viewing Port Traffic

The **Port Traffic** screen displays a graph that shows the utilization percentage (Y-axis) over a specific time period (X-axis). You can also adjust the time period for the data that is displayed by changing the starting date and ending date. The minimum interval you can select is one day and the maximum interval you can select is 90 days.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and the following toolbar appear when a link is selected.

3. Navigate to **Link Traffic** > **Port Traffic**.

The **Port Traffic** screen will appear.

4. To adjust the time period for the graph data:
  - a. Click the **From** date and select a new starting date.
  - b. Click the **To** date and select a new ending date.
5. Hover over a line to view the direction of traffic.

For example, the green line at the top of the following graph represents traffic from **192.168.127.1 (device IP address) Port 1** to **192.168.127.103 (device IP address) Port 4**.

# Viewing Packet Error Rates

The **Packet Error Rate** screen displays a graph that shows the packet error rate (Y-axis) over a specific time period (X-axis). You can also adjust the time period for the data that is displayed by changing the start and end dates. The minimum interval is one day and the maximum interval you can select is 90 days.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and toolbar appear when a link is selected.

3. Navigate to **Link Traffic** > **Packet Error Rate**.

The **Packet Error Rate** screen appears.

4. To adjust the time period for the graph data:
  - a. Click the **From** date and select a new starting date.
  - b. Click the **To** date and select a new ending date.
5. Hover over a line to view the packet error rate.

# Monitoring Traffic Loads

MXview One collects the traffic load information of every link and displays the information to provide users with a network-wide view.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and displays the Topology Map by default.

2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.

The **Topology** screen will display a graphical representation of the devices and links on your network.

3. From the toolbar menu, navigate to **Visualization** > **Traffic View**.

The **Traffic Load** legend will appear and the Topology Map color-codes each link to indicate the traffic load.

## NOTE

The Group section on the right-hand side of the screen shows the link with the highest traffic load within each group.

# Monitoring Network Security

ISA/IEC 62443 is a continuously evolving cybersecurity standard whose guidelines have already been adopted in many industrial automation applications. This standard, including its subsections, aims to cover points such as general requirements, policies and procedure, system-level requirements, and component-level requirements.

Moxa's MXview One follows Moxa's security guidelines, which are based on the IEC 62443-4-2 component-level recommendations. Security View checks the security level of Moxa's network devices. There are five levels for checking the results in Security View:

- High
- Medium
- Basic

- Open: Security Level below basic
- Unknown: Devices without security-related information for MXview One

## NOTE

The definition of general baseline is based on several industrial cybersecurity policies and requirements.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.

The **Topology** screen will display a graphical representation of the devices and links on your network.

3. From the toolbar menu, navigate to **Visualization** > **Security View**.

The **Security View** window will appear and the Topology Map indicates the security level of each device with a color-coded circle.

4. To filter the devices in the **Security View** window by security level:

- a. Click the **Filter** (☰) icon.
- b. Select the security level.

The **Security View** window filters the list of devices to only show devices that match the selected security level.

5. To locate a device in the Topology Map, click the device in the Security View window.

The **Security View** details pane will appear on the right and the Topology Map highlights the circle around the device.

6. View security details for a specific device by using one of the following methods:
- Select a device from the Topology Map.
  - Select a device from the **Security View** window.

The **Security View** details pane will appear and displays the device security level and security-related configuration statuses.

7. View the Security View Report:

Click **Export** to export the Security View Report in either CSV or PDF format.

8. Review the following items in the Security View details pane:

| Item                                          | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Auto Logout                            | Check if the Auto Logout function is enabled.                                                                                                                                                                                                                                                                                                                   |
| Set Login Message                             | Check if both the Web Login Message and Web Login Fail Message are configured.                                                                                                                                                                                                                                                                                  |
| Disable Non-encrypted TCP/UDP Ports           | Check if non-encrypted TCP/UDP Ports are disabled. HTTP, Telnet, and Moxa Proprietary Protocol should be disabled. SNMP must be set to V3 only.                                                                                                                                                                                                                 |
| Enable Account Login Failure Lockout          | Check if the Account Login Failure Lockout function is enabled.                                                                                                                                                                                                                                                                                                 |
| Enable Trusted Access                         | Check if the Trusted Access function is enabled or not. At least one rule must be set.                                                                                                                                                                                                                                                                          |
| Enable Password Complexity Strength Check     | Check if the Password Complexity Strength Check function is enabled.                                                                                                                                                                                                                                                                                            |
| Enable Configuration File Encryption          | Check if the Configuration File Encryption function is enabled. At least one rule must be enabled.                                                                                                                                                                                                                                                              |
| Enable DDoS Protection                        | Check if Broadcast Storm Protection is enabled. For eCos switches, MXview One checks whether Broadcast Storm Protection is enabled. For EDR routers, MXview One checks whether at least one form of DoS protection is enabled. For MXnos switches, MXview One checks whether at least one of the following is enabled: Broadcast, Multicast, or DLF protection. |
| Set SNMP Trap/Inform or Syslog Server         | Check if the SNMP Trap/Inform or Syslog Server is set.                                                                                                                                                                                                                                                                                                          |
| Change Default Password/SNMP Community String | Check if the Default Password or SNMP Community String is set.                                                                                                                                                                                                                                                                                                  |
| Enable SSL/TLS High Secure Mode               | Check if the HTTPS is enabled and HTTP is disabled.                                                                                                                                                                                                                                                                                                             |

## NOTE

Users can use Security Wizard function in MXconfig to easily set the Security View status of devices.

9. To modify the colors used to indicate the security levels:
- Navigate to **Menu** (☰) > **Administration** > **Preferences**.  
The **Preferences** screen will appear.
  - Under the **Appearance** section, expand **Security View**.
  - In the **Colors for check result** section, modify the color used to indicate a security level.

# Configuring Severity Thresholds for Traffic and Fiber Status Monitoring Events

MXview One allows you to configure the following traffic conditions on a link to trigger events:

- Bandwidth utilization is over the threshold.
- Bandwidth utilization is under the threshold.
- Packet error rate is over the threshold.
- Fiber Rx is under the threshold.
- Fiber Tx is under the threshold.
- Fiber temperature is over the threshold.
- Fiber voltage is under the threshold.
- Fiber voltage is over the threshold.

Since a link is bidirectional, the event will be triggered when the traffic condition in either direction satisfies the configured severity threshold.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and toolbar appear when a link is selected.

3. Click **Severity Threshold**.

The **Severity Threshold** screen will appear.

The 'Severity Threshold' configuration window has three tabs: 'Bandwidth Utilization' (selected), 'Packet Error Rate', and 'SFP Threshold'. Under 'Bandwidth Utilization', there are two sections. The first is 'Over \*' with a value of '0' and a '%' sign, and a severity dropdown set to 'Warning'. The second is 'Under \*' with a value of '0' and a '%' sign, and a severity dropdown set to 'Warning'. At the bottom right are 'Cancel' and 'Apply' buttons.The 'Severity Threshold' configuration window has three tabs: 'Bandwidth Utilization', 'Packet Error Rate' (selected), and 'SFP Threshold'. Under 'Packet Error Rate', there is one section: 'Over \*' with a value of '0' and a '%' sign, and a severity dropdown set to 'Warning'. At the bottom right are 'Cancel' and 'Apply' buttons.

4. To trigger an event when the bandwidth utilization on a link exceeds a specified percentage:
  - a. Click the **Bandwidth Utilization** tab.
  - b. In the **Over** field, specify the maximum bandwidth utilization percentage.
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
5. To trigger an event when the bandwidth utilization on a link falls below a specified percentage:
  - a. Click the **Bandwidth Utilization** tab.
  - b. In the **Under** field, specify the minimum bandwidth utilization percentage.
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
6. To trigger an event when the packet error rate exceeds a specified percentage:
  - a. Click the **Packet Error Rate** tab.
  - b. In the **Over** field, specify the maximum bandwidth utilization percentage.
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
7. To trigger an event when the SFP Tx falls below a specific range:
  - a. Click the **SFP Threshold** tab.
  - b. In the **SFP Tx Under** field, specify the maximum Tx threshold in dB (0~-100)
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical

8. To trigger an event when the SFP Rx falls below a specific range:
  - a. Click the **SFP Threshold** tab.
  - b. In the **SFP Rx Under** field, specify the maximum Rx threshold in dB (0~-100)
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
9. To trigger an event when the SFP voltage falls below a specific range:
  - a. Click the **SFP Threshold** tab.
  - b. In the **SFP Voltage Under** field, specify the maximum voltage in V (0~10)
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
10. To trigger an event when the SFP voltage exceeds a specific range:
  - a. Click the **SFP Threshold** tab.
  - b. In the **SFP Voltage Over** field, specify the minimum voltage in V (0~10)
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
11. To trigger an event when the SFP temperature exceeds a specific range:
  - a. Click the **SFP Threshold** tab.
  - b. In the **SFP Temperature Over** field, specify the minimum temperature in Celsius (0~100)
  - c. From the adjacent drop-down list, select one of the following severity levels:
    - ☐ Information
    - ☐ Warning
    - ☐ Critical
12. Click **Apply**.

MXview One will update the modified settings.
13. (Optional) Configure the Severity Threshold and Fiber status:
  - a. Navigate to **Menu** () > **Administration** > **Global Device Settings**.

The **Global Device Settings** screen appears.
  - b. To set the threshold, you can go to the sections below to complete the settings.
    - ☐ Bandwidth Utilization
    - ☐ Packet Error Rate
    - ☐ SFP Threshold
  - c. Click **Save**.

MXview updates the web console protocol settings.

## NOTE

If you complete the Bandwidth Utilization, Packet Error Rate, and SFP Threshold settings in the Global Device Settings section, the settings will be implemented to all the devices in your topology.

# Configuring Custom Port Labels

MXview One uses the following port labelling convention to identify directions of traffic on a link.

**<Device IP Address> / <Port Number>**

You can use the Set Port Label screen to customize the port labels.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and toolbar appear when a link is selected.

3. Click **Set Port Label**.

The **Set Port Label** screen appears.

A dialog box titled 'Set Port Label' in teal. It contains a checkbox labeled 'Use Custom Label'. Below the checkbox, there are two text input fields. The first field is labeled 'From: 10.81.10.12 / Port 8' and the second field is labeled 'To: 10.81.10.11 / Port 8'. At the bottom right, there are two buttons: 'Cancel' and 'Apply'.

4. Select the **Use Custom Label** check box.
5. In the **From** field, provide a new label for the source port.
6. In the **To** field, provide a new label for the destination port.
7. Click **Apply**.

# 9. SFP Fiber Status

## Viewing the SFP Fiber Status in Table View

MXview One collects and display fiber status in **SFP > SFP List**

The list shows Fiber TX, RX, temperature, and voltage of the cables that are connected.

SFP List

Search

|                                    | TX (dBm) | RX (dBm) | Temp. (°C) | Volt. (V) |                                    | TX (dBm) | RX (dBm) | Temp. (°C) | Volt. (V) |

# Synchronize the SFP Threshold From the Device

MXview One can synchronize the threshold from devices, which can detect Moxa's SFP connector to get the specific threshold.

Navigate to **SFP > Sync Threshold From the Device**

Click **Sync** and the threshold from the devices will sync to the SFP Threshold of every link.

# 10. Device Operation in the Topology

The MXview One **Topology** screen provides several features and tools for managing and maintaining devices in your network topology.

## Viewing the Device List

The **List view** on the **Topology** screen will display a list of discovered devices in your network topology. You can also use this view to manually add devices to your network topology or export filtered data as a CSV file.

The screenshot shows the MXview ONE interface with the Topology screen selected. The List view is active, displaying a table of discovered devices. The table has columns for Device Alias, Model, Device IP, MAC Address, Firmware Version, and Location. The interface includes a search bar and a list of devices with checkboxes for selection.

| <input type="checkbox"/> | Device Alias                   | Model           | Device IP       | MAC Address       | Firmware Version          | Location        |
|--------------------------|--------------------------------|-----------------|-----------------|-------------------|---------------------------|-----------------|
| <input type="checkbox"/> | 192.168.123.72-AWK-1151C       | AWK-1151C       | 192.168.123.72  | 00:90:E8:05:17:45 | v2.0 Build 2022_1007_1814 |                 |
| <input type="checkbox"/> | 192.168.127.11-EDS-G516E       | EDS-G516E       | 192.168.127.11  | 00:90:E8:54:E1:E6 | V6.3 build 23032200       | Test            |
| <input type="checkbox"/> | 192.168.127.12-EDS-G4008       | EDS-G4008       | 192.168.127.12  | 00:90:E8:8F:F0:18 | v3.1 Build 2023_0217_1005 | aa              |

| <input type="checkbox"/> | 192.168.127.29-PT-G7728        | PT-G7728        | 192.168.127.29  | 00:90:E8:99:E9:08 | V6.2 build 21110316       | Switch Location |
| <input type="checkbox"/> | 192.168.127.32-Hirschmann      | Hirschmann      | 192.168.127.32  | 00:80:63:B3:B2:80 |                           | Hirschmann MACH |
| <input type="checkbox"/> | 192.168.127.222-ICMP Device    | ICMP Device     | 192.168.127.222 | 00:E0:99:01:2A:68 |                           |                 |

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map in Topology view.
2. Click the **List view** (☰) icon in the top right corner.  
The **Topology** screen displays a list of devices on your network.

3. To add a device to your network topology:

- a. Click **Edit > Add Device**.

The **Add Device** screen will appear.

**Add Device**

IP Address \*

Assign Model \*      Assign to Group \* ▼

SNMP Version \*      Port \*

V1      161

Username      Password

admin     

Read Community      Write Community

public      private

Data Encryption      Authentication

NoAuth      MD5

Encryption Protocol      Encryption Password

DES     

Cancel      Add

- b. Configure the following:

- ☐ **IP Address:** Specify the IP address of the device
- ☐ **Assign Model:** Select the model of the device
- ☐ **Assign To Group:** Select the group to assign the device to
- ☐ **SNMP Version:** Select the SNMP version
- ☐ **Username:** Specify the device login Username
- ☐ **Password:** Create a password
- ☐ **Read Community:** Specify the SNMP read community string
- ☐ **Write Community:** Specify the SNMP write community string
- ☐ **Data Encryption:** Select the data encryption method
- ☐ **Authentication:** Select the authentication method
- ☐ **Encryption Key:** Specify the encryption key

- c. Click **Add**.

MXview One adds the device to the topology.

4. To delete devices in your network topology:

- a. Check the box on the first column of devices.

- b. Click the **Delete** (🗑️) icon on the menu bar. The **Delete Device** screen appears.

- c. For non AWK devices, read the message and then click **Delete** if you are sure you want to delete the device.

**Delete Device**

Are you sure you want to delete this device?

Cancel      Delete

- d. For AWK devices, read the message and wait for the countdown. Click **Delete** if you are sure you want to delete the device.

## NOTE

If you click the check box for all the devices, when you click the Delete icon, you will delete all the devices in the topology.

5. To view device properties, select the check box next to the **Device Alias**. The **Device Properties** details pane will appear.

6. To filter the device list by severity level:
- Click the **Filter** (≡) icon in the top left corner. The **Severity** drop-down list appears.

- b. Select one of the following severity levels:
  - ☐ **Critical**
  - ☐ **Warning**
  - ☐ **Information**
- c. Click **Apply**.  
MXview One filters the device list to only display devices with the selected severity level.
7. To export the device list:
  - a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.  
MXview One will export the displayed data as a CSV file.

## Importing Device Configurations

Use the **Topology** screen to import an INI-formatted configuration file to a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device that you want to import configurations to:
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the site name in the Device List.

The toolbar options change.

4. Navigate to **Device Control** > **Import Config**.  
The **Import Config** screen appears and indicates the IP address of the selected device.

 A screenshot of the 'Import Config - 192.168.127.252' dialog box. It has a title bar with the device IP. Below the title, there is a text input field labeled 'Import Config \*' with a folder icon to its right. Underneath the input field, it says 'The maximum file size is 1 MB.' Below that, there is a note: '\* Please make sure the username and password for this device are correctly set in "Advanced Settings"'. At the bottom right, there are two buttons: 'Cancel' and 'Import'.

5. Click the folder (📁) icon to upload the configuration file from your local machine.
6. Click **Import**.  
MXview One imports the configuration file to the specified device.

# Exporting Device Configurations

Use the **Topology** screen to export an INI-formatted configuration file from a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device that you want to export configurations from.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Device Control** > **Export Config**.

The **Export Config** screen will appear and indicate the IP address of the selected device.

5. Click **Export**.  
MXview One exports the device configurations as an INI file in the specified location.

# Upgrading Firmware

Use the **Topology** screen to upgrade the firmware (ROM-formatted file) on a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - b. **List view:** Displays a list of the devices in your network topology.
3. Select the device that you want to upgrade the firmware for:
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Device Control** > **Upgrade Firmware**.  
The **Upgrade Firmware** screen appears and indicates the IP address of the selected device.

### Upgrade Firmware - 192.168.127.252

Upgrade Firmware \*

\* Please make sure the username and password for this device are correctly set in "Advanced Settings"

Cancel

Upgrade

5. Click the folder (📁) icon to upload the ROM-formatted firmware file from your local machine.
6. Click **Upgrade**.  
MXview One will upgrade the firmware on the specified device.

# Configuring SNMP Trap Server

MXview One can collaborate with other network management software and send SNMP Traps to non-Moxa NMS. MXview One supports up to two trap servers depending on the device.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Device Configuration** > **Trap Server**.

The **Trap Server** screen appears.

5. Configure the following SNMP trap server settings for the device:
  - **Destination IP1**
  - **Community Name1**
  - (Optional) **Destination IP2**
  - (Optional) **Community Name2**
6. Click **Apply**.  
MXview One sends SNMP traps to the configured trap server(s) when events are detected on the device.

## NOTE

When a device fails to reply within seven seconds, MXview One will display the message "Failed to update device Trap server settings." Please confirm the execution results via the same settings page or go to the web page of the devices.

# Configuring Port Settings

Use the **Topology** screen to configure port settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options will change.

4. Navigate to **Device Configuration > Ethernet/Fiber Port Settings**.

The **Ethernet/Fiber Port Setting** screen appears.

**Ethernet/Fiber Port Settings**

Port \*  
1

Enable \*  
Enabled

Media Type  
1000TX,RJ45,POE

Port Description

Apply settings to another port

\*If the port settings fail, please go to device's web console by following this path: Port > Port Settings to confirm whether the selected port can be configured or not.

Cancel Apply

5. Configure the following port settings for the device:
  - **Port:** Select the port number.
  - **Enable:** Enable or disable the port.
  - **Port Description:** Provide a description of the port.
  - **Apply settings to another port:** Select to apply the configured settings to other ports on the device.
6. Click **Apply**.  
MXview One will update the port settings to the device.

# Configuring SNMP Communication Protocol

Use the **Topology** screen to configure SNMP settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options will change.

4. Navigate to **Device Configuration** > **SNMP Communication Protocol**.

The **SNMP Communication Protocol** screen will appear.

5. Configure the following SNMP settings for the device:
  - **SNMP Version**
  - **SNMP Port**
  - **Username**
  - **Password**
  - **Read Community**
  - **Write Community**
  - **Data Encryption**
  - **Authentication**
  - **Encryption Protocol**
  - **Encryption Password**
6. Click **Apply**.  
MXview One updates the SNMP communication protocol settings to the device.

## NOTE

For the first time, users can use the Default Device Template function to set the function template. For more information, see **Changing Default SNMP Configuration**.

# Configuring MXview One Polling Interval

Use the **Topology** screen to configure ICMP or SNMP polling settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Device Configuration > MXview One Polling Interval**.

The **MXview One Polling Interval** screen appears.

5. Configure the following polling settings for the device:
  - **ICMP polling interval**
  - **SNMP polling interval**
6. Click **Apply**.  
MXview One will update the polling settings for the device.

## NOTE

For the first time, users can use the Default Device Template function to set the function template. For more information, see **Default Device Template**.

# Configuring Device Accounts

Use the **Topology** screen to configure advanced settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Device Configuration** > **Device Accounts**.

The **Device Accounts** screen appears.

A screenshot of the 'Device Accounts' configuration window. It has a title bar 'Device Accounts'. Below it are two input fields: 'Username' with the text 'admin' and 'Password' with masked characters '\*\*\*\*'. To the right of the password field is an eye icon. At the bottom right are two buttons: 'Cancel' and 'Apply'.

5. Enter the **Username** and **Password** for the device web console.
6. Click **Apply**.  
MXview One updates the advanced settings.

# Modifying the Device Alias

Use the **Topology** screen to configure advanced settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Device Configuration** > **Device Alias**.

The **Device Alias** screen appears.

A screenshot of a web form titled 'Device Alias' in teal. Below the title is a label 'Alias' in gray. The input field contains the text '192.168.127.14--EDS-G512E-8PoE'. To the right of the input field is a character count '30 / 63'. At the bottom right of the form are two buttons: 'Cancel' in teal text and 'Apply' in a teal button.

5. Edit the **Alias** field.
6. Click **Apply**.  
MXview One updates the advanced settings.

# Changing the Device Icon

Use the **Topology** screen to change the device icon by selecting the device from the **Topology Map** or **Device List**, and then upload a JPG, GIF, or PNG image file. You can change the icon for multiple devices at once.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device(s).
  - **Topology view:** Click the icon of the device in the Topology Map. To select multiple devices, click and drag over the devices or CTRL + left-click the devices individually.
  - **List view:** Select the check box next to the device(s) in the Device List.

The toolbar options will change.

4. Navigate to **Device Configuration** > **Change Device Icon**.  
The **Change Device Icon** screen appears.

5. Click the folder (📁) icon to upload the device icon from your local machine. (The maximum image size is 100 KB.)
6. Click **Apply**.  
MXview One will change the device icon(s) to the uploaded JPG, GIF, or PNG image file.

# Signing on to Device Web Consoles

MXview One allows you to use the **Topology** screen to the web console for a device from the **Topology Map** or **Device List**.

## NOTE

You can use the **Global Device Settings** screen to configure the web console protocol. The web console protocol can be set to HTTP or HTTPS, and then the port numbers of the HTTP and HTTPS can be set by users.

1. (Optional) Configure the web console protocol:
  - a. Navigate to **Menu** (☰) > **Administration** > **Global Device Settings**.  
The **Global Device Settings** screen appears.
  - b. Find the **Management Interface** to complete the settings.

**Management Interface**

Web Console Protocol  
HTTP

HTTP Port \*  
80

HTTPS Port \*  
443

**Save**

- c. Configure the following:
    - ☐ **Web Console Protocol**
    - ☐ **HTTP Port**
    - ☐ **HTTPS Port**
  - d. Click **Save**.  
MXview One updates the web console protocol settings.

## NOTE

If you complete the Management Interface settings in the Global Device Settings section, the settings will be applied to all the devices in your topology.

2. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
3. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
4. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

5. Navigate to **Web Console**.  
The login screen for device web console appears in a new browser tab.

## NOTE

You may need to allow pop-ups on your web browser in order to view the device web console.

6. Enter the **Username** and **Password** for the device web console.
7. Click **Login**.  
The device web console will successfully log in.

## Managing and Running Scripts

The **Run Script** function allows you to quickly perform a set of actions on one or multiple devices at once. You can run scripts on selected devices from the **Topology** or **Device Management** screen.

Click the **Run Script** (  ) icon in the menu bar to expand the script functions. There are two main functions:

- **Run CLI Script:** Write and run a CLI script and test if the script works correctly.
- **Run Saved Script:** Select and run a CLI Script from the Saved CLI Scripts database. Refer to the [Saved CLI Scripts](#) section.

## Running a CLI Script

1. In the **Topology** or **Device Management** screen, select the device(s) to run the script on.
2. Click the **Run Script** (  ) icon in the menu bar and click **Run CLI Script**.  
The **Run CLI Script** window will appear.

3. Enter the script:
  - a. In the CLI Script field, enter the CLI command(s) to execute.
  - b. Confirm the selected devices that the script will be executed on.
  - c. Click **Run**.

4. The system will show the script execution status for each device.

### Run CLI Script

 **CLI Execution Results**  
If you leave this screen, you can download the execution results from [Saved CLI Scripts > Execution Results](#).

| IP             | Alias                          | Model           | Status          |
|----------------|--------------------------------|-----------------|-----------------|
| 192.168.127.12 | 192.168.127.12-EDS-G4008       | EDS-G4008       | In Progress ... |
| 192.168.127.16 | 192.168.127.16-EDS-4012-8P-4GS | EDS-4012-8P-4GS | In Progress ... |

## NOTE

You cannot perform any actions on the device while the script is running. If you close the MXview One web page, you can download the execution results from **Saved CLI Scripts > Execution Results** page.

5. Check the script results.

When all devices have finished running the script, click the **Expand** (  ) icon next to the device to check the result.

### Run CLI Script

[Close](#) [Run](#) [Save as a CLI Script](#)

6. You can either run or save the script:
  - a. **Run script:** Modify the CLI script (if necessary) and click **Run**. The system will execute the CLI script on the selected devices.
  - b. **Save script:** Click **Save as a CLI Script** to save the CLI script for future use. The **Save CLI Script** window will appear.

The 'Save CLI Script' dialog box contains the following fields and controls:

- Name \***: A text input field with a character count of 0 / 64.
- Description \***: A text input field with a character count of 0 / 255.
- CLI Script**: A large text area containing the script content 'show interfaces description'. It has a character count of 27 / 9999.
- Buttons**: 'Cancel', 'Back', and 'Save' buttons are located at the bottom right.

- i. Enter a name and description for the script.  
The CLI Script field is read-only and cannot be modified here.
- ii. Click **Save**. A confirmation message will appear.

New CLI script created successfully

- iii. The CLI script will be stored and shown in the **Saved CLI Scripts** section.

The 'Saved CLI Scripts' page shows a table of saved scripts. The table has columns for Name, Description, Linked Scheduled Tasks, and Linked Script Automations. There are three scripts listed:

|                          | Name                  | Description                | Linked Scheduled Tasks | Linked Script Automations              |
|--------------------------|-----------------------|----------------------------|------------------------|----------------------------------------|
| <input type="checkbox"/> | reload-task           | reload-description         |                        | start-btn, diff_cli-btn, same_cli_btn1 |
| <input type="checkbox"/> | reload-task-new       | reload-description-new     |                        | diff_cli-btn, same_cli_btn2            |
| <input type="checkbox"/> | Interface description | Show interface description |                        |                                        |

## Running a Saved CLI Script

1. In the **Topology** or **Device Management** screen, select the device(s) to run the script on.
2. Click the **Run Script** () icon in the menu bar and click **Run Saved Script**. The **Run Saved Script** window will appear.

**Run Saved Script**

Select a CLI Script

Q Search

| CLI Script Name                             | Description                |
|---------------------------------------------|----------------------------|
| <input type="radio"/> Interface description | Show interface description |

Cancel Run

If no saved scripts can be found, the following message will appear.

**Run Saved Script**

 "No CLI scripts found. Add a CLI script first from Saved CLI Scripts"

[Add a CLI Script](#)

Close

Click the **Add a CLI Script** to create a script. Refer to [Adding a CLI Script](#).

3. Select the script you want to execute and confirm the selected devices that the script will be executed on. You can modify the script if necessary.

**Run Saved Script**

Select a CLI Script

Q Search

| CLI Script Name                                        | Description                |
|--------------------------------------------------------|----------------------------|
| <input checked="" type="radio"/> Interface description | Show interface description |

CLI Script

```
show interfaces description
```

**Selected Devices**

| IP             | Alias                          | Model           |
|----------------|--------------------------------|-----------------|
| 192.168.127.12 | 192.168.127.12-EDS-G4008       | EDS-G4008       |
| 192.168.127.16 | 192.168.127.16-EDS-4012-8P-4GS | EDS-4012-8P-4GS |

Cancel Run

4. Click **Run**.

5. The system will show the script execution status for each device.

**Run CLI Script**

 **CLI Execution Results**  
If you leave this screen, you can download the execution results from [Saved CLI Scripts > Execution Results](#).

| IP             | Alias                          | Model           | Status          |
|----------------|--------------------------------|-----------------|-----------------|
| 192.168.127.12 | 192.168.127.12-EDS-G4008       | EDS-G4008       | In Progress ... |
| 192.168.127.16 | 192.168.127.16-EDS-4012-8P-4GS | EDS-4012-8P-4GS | In Progress ... |

## NOTE

You cannot perform any actions on the device while the script is running. If you close the MXview One web page, you can download the execution results from **Saved CLI Scripts > Execution Results** page.

6. Check the script results

When all devices have finished running the script, click the **Expand** (  ) icon next to the device to check the result.

**Run Saved Script**

 **CLI Execution Results**  
If you leave this screen, you can download the execution results from [Saved CLI Scripts > Execution Results](#).

# Changing Device Groups

Use the **Topology** screen to change the assigned group for a device by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Click **Change Group**.

The **Change Group** screen will appear and displays the following information:

5. (Optional) Select additional IP addresses to assign other devices from the current group to the new group.
6. From the **Assign to Group** drop-down list, select the new group that you want to assign the selected device(s) to.
7. Click **Apply**.  
MXview One will assign the selected device(s) to the new group.

# Refreshing the Device Status

Since some device data is collected by polling, there may be a time delay for some data. Use the **Topology** screen to refresh the device status by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Click **Refresh**.  
MXview One polls the device for updated data.

# Deleting Devices

Use the **Topology** screen to delete devices from the Topology Map. After a device is deleted, it will be removed from the topology map and the device will not be polled.

1. Navigate to **Menu** (☰) > **Topology**.  
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
  - **Topology view:** Displays a graphical representation of the devices in your network topology.
  - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
  - **Topology view:** Click the icon of the device in the Topology Map.
  - **List view:** Select the check box next to the device in the Device List.

The toolbar options will change.

4. Click **Delete**.  
MXview One removes the device from your network topology.

# 11. Device Management

The **Device Management** feature lets users perform certain functions directly from within MXview One, without having to enter the device's web console. This feature covers two sections: **Configuration and Control** and **Account and Password**.

The **Device Configuration and Control** section provides quick access buttons to quickly execute commonly used device management functions. Users can perform these functions either from the menu bar on the **Topology** screen, or directly from the **Configuration and Control** page.

The **Account and Password** section allows administrators to check device accounts and perform account and default password audits.

## Configuration and Control

### Configuration and Control Overview

To access the Configuration and Control page, in the function tree, navigate to **Menu (☰) > Device Management > Configuration and Control**.

At the top of this screen is the menu bar which provides quick access buttons for device management functions. At the bottom part of the page is the device list which allows users to select the devices to perform the quick function on.

The quick access functions are organized into four main types:

- Device Configuration
- Device Control
- Cybersecurity Controls
- Run Script

| Device Alias                  | Model         | Device IP       | MAC Address       | Firmware Version          | Location       |

Refer to the following section for an overview of all functions in each category.

# Device Configuration

## Change Wi-Fi Channel

If the performance of your wireless devices is affected by interruptions in the current Wi-Fi channel, you can use the Change Wi-Fi Channel function to switch to another channel to improve performance.

1. Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.
2. Select the device(s) to configure from the device list.

3. From the **Device Configuration** drop-down list, select **Change Wi-Fi Channel**. The **Change Wi-Fi Channel** screen will appear.

4. Modify the Wi-Fi channel settings.

### Change Wi-Fi Channel

Cancel **Retry Failed Devices**

## Add Wi-Fi SSID

Use the **Add Wi-Fi SSID** function to create additional Wi-Fi SSIDs for your wireless environment.

- Navigate to **Menu**  > **Device Management** > **Configuration and Control**.
- Select the device(s) to configure from the device list.

| MXview ONE                                                                                                                                  |           |                |                   |                           |                 |  |

| Setting                                                          | Description                            |
|------------------------------------------------------------------|----------------------------------------|
| Open<br>WPA<br>WPA2<br>WPA3<br>WPA/WPA2 Mixed<br>WPA2/WPA3 Mixed | Select the security mode for the SSID. |

When using any security mode other than **Open**, configure the following settings:

#### WPA Mode

| Setting  | Description                                                  |
|----------|--------------------------------------------------------------|
| Personal | Authenticate WPA, WPA2, or WPA3 with a Pre-shared key (PSK). |

#### Protected Management Frame

| Setting | Description |
|---------|-------------|
|---------|-------------|

|          |                                                                                       |
|----------|---------------------------------------------------------------------------------------|
| Disabled | Disable the protected management frame. This option is not available when using WPA3. |
| 802.11w  | Use the 802.11w protocol as the protected management frame.                           |

### Encryption

| Setting        | Description                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AES            | Use Advance Encryption System (AES) encryption.                                                                                                                                                  |
| TKIP/AES Mixed | Use TKIP/AES Mixed encryption. This option provides a TKIP broadcast key and TKIP+AES unicast key to support legacy AP clients. This option is rarely used and is not available when using WPA3. |

### EAPOL Version

| Setting | Description                                                |
|---------|------------------------------------------------------------|
| 1       | Use EAPOL Version 1 as the security authentication method. |
| 2       | Use EAPOL Version 2 as the security authentication method. |

### Passphrase

| Setting            | Description                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------|
| 8 to 63 characters | Enter the passphrase. This is the master key to generate keys for encryption and decryption. |

- When finished, click **Add**. The system will execute the action.

| Add Wi-Fi SSID |                          |           |                 |

## Dynamic Sticky MAC

Use the **Dynamic Sticky MAC** function to configure Dynamic Sticky MAC settings for one or multiple selected devices at once.

- Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.

2. Select the device(s) to configure from the device list.

| Device Alias                                                 | Model     | Device IP      | MAC Address       | Firmware Version          | Location        |
|--------------------------------------------------------------|-----------|----------------|-------------------|---------------------------|-----------------|
| <input type="checkbox"/> 192.168.3.16-AWK-1161C              | AWK-1161C | 192.168.3.16   | 00:90:E8:11:61:C2 | v2.0 Build 2023_0417_0232 | a               |
| <input type="checkbox"/> 192.168.3.65-AWK-1165A              | AWK-1165A | 192.168.3.65   | 00:90:E8:11:65:49 | v2.0 Build 2023_0418_1026 |                 |
| <input type="checkbox"/> 192.168.123.72-AWK-1151C            | AWK-1151C | 192.168.123.72 | 00:90:E8:05:17:45 | v2.0 Build 2023_0217_1145 |                 |
| <input checked="" type="checkbox"/> 192.168.123.73-AWK-4252A | AWK-4252A | 192.168.123.73 | 00:90:E8:9D:C4:FE | v2.0 Build 2023_0217_1145 |                 |
| <input type="checkbox"/> 192.168.127.25-PT-G7728             | PT-G7728  | 192.168.127.25 | 00:90:E8:71:1E:A5 | V6.3 build 22120913       | Switch Location |

3. From the **Device Configuration** drop-down list, select **Dynamic Sticky MAC**. The **Dynamic Sticky MAC** screen will appear.

| Device Alias                                                | Model     | Device IP      | MAC Address       | Firmware Version          | Location        |
|-------------------------------------------------------------|-----------|----------------|-------------------|---------------------------|-----------------|
| <input type="checkbox"/> 192.168.3.16-AWK-1161C             | AWK-1161C | 192.168.3.16   | 00:90:E8:11:61:C2 | v2.0 Build 2023_0417_0232 | a               |
| <input type="checkbox"/> 192.168.3.65-AWK-1165A             | AWK-1165A | 192.168.3.65   | 00:90:E8:11:65:49 | v2.0 Build 2023_0418_1026 |                 |
| <input type="checkbox"/> 192.168.123.72-AWK-1151C           | AWK-1151C | 192.168.123.72 | 00:90:E8:05:17:45 | v2.0 Build 2023_0217_1145 |                 |
| <input type="checkbox"/> 192.168.123.73-AWK-4252A           | AWK-4252A | 192.168.123.73 | 00:90:E8:9D:C4:FE | v2.0 Build 2023_0217_1145 |                 |
| <input checked="" type="checkbox"/> 192.168.127.25-PT-G7728 | PT-G7728  | 192.168.127.25 | 00:90:E8:71:1E:A5 | V6.3 build 22120913       | Switch Location |

## NOTE

You can only select devices with the same port format (either non-modular or modular device) and the same number of ports to execute the Dynamic Sticky MAC function. For example, you can set multiple non-modular switches at the same time, but not non-modular and modular switches. Because non-modular switch and modular switches have different port formats. An error message will appear if the selection is incompatible.

**⚠ Models must have the same port format and number of ports.**

- Click the Add (  ) icon and configure the following settings:

## Serial Port Monitoring

### NOTE

This function is only supported by the NPort 6000 Series and NPort 6000-G2 Series.

Use the **Serial Port Monitoring** function to configure event trigger rules for triggering serial port events.

- Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.
- Select the NPort 6000 Series or NPort 6000-G2 Series device(s) to configure from the device list.

Apply

- ☐ **Serial Port:** Select the device port(s) to apply the event trigger rule to.
  - ☐ **Event Type:** Select the rule event property.
  - ☐ **No Data Period:** If the Event Type is set to RX Inactivity, TX Inactivity, or TX & RX Inactivity, specify the duration the port does not transmit or receive data before triggering a no data event.
  - ☐ **Trigger Threshold:** If the Serial Port Properties to any Error Count type, specify the number of consecutive error counts the serial can receive before triggering an error event.
  - ☐ **Severity:** Select the event severity for this rule.
- b. (Optional) If there are other devices of the model type in the topology, use the **Condition Copy** option to copy the event trigger rules to these devices.
  - c. Click **Apply**.

## NOTE

MXview One supports a maximum of 64 event trigger rules. Different rules cannot have identical Serial Port and Event Type settings.

6. To delete an event trigger rule:
  - a. Click the Delete (🗑️) icon next to the rule you want to delete.
7. When a serial port event is triggered, a yellow triangle icon will appear the above affected devices in the Topology screen. Click the device icon to show the event list.

- Click the **How to resolve?** link to open a pop-up window with step-by-step instructions to resolve the issue.

### Resolve Serial Port 1 Issue

Try these steps to resolve the "Serial port {{port}} has not transmitted and received any data in the last {{min}} minutes" issue.

1. Check if the serial cable is properly connected to the Moxa device and the serial end devices.
2. Check if the connected serial device(s) are working properly.

**Still not working?**  
If you have further questions, contact your [channel partner](#) first.  
Contact [Moxa Technical Support](#) if you still need additional support.

Close

## Device Control

### Reboot

Use the **Reboot** function to manually reboot devices or configure a reboot schedule.

- Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.
- Select the device(s) to configure from the device list.

4. Configure the reboot sequence and execution time.

### Reboot

Reboot Sequence  
Smart Sequential

| Order | IP             | Alias                   | Model    |
|-------|----------------|-------------------------|----------|
| 1     | 192.168.127.29 | 192.168.127.29-PT-G7728 | PT-G7728 |
| 2     | 192.168.127.31 | 192.168.127.31-PT-G503  | PT-G503  |

Cancel
Add to Scheduler
Reboot

- Select the reboot sequence:
    - ☐ **Strict Sequential:** Reboot the devices based on the device sequence in the topology starting from the device furthest away from the computer running MXview One, proceeding to the nearest one.
    - ☐ **Smart Sequential:** Reboot the devices based on the device sequence in the topology but simultaneously reboot all devices in the same topology layer.
  - Select an execution time:
    - ☐ **Reboot:** Click **Reboot** to restart the devices instantly.
    - ☐ **Add to Scheduler:** Click **Add to Scheduler** to create a new scheduled task. MXview One will reboot the devices based on the specified time and date in the schedule.
5. To reboot devices instantly, click **Reboot**. The system will execute the action.

### Reboot

| IP             | Alias                   | Model    | Status          |
|----------------|-------------------------|----------|-----------------|
| 192.168.127.29 | 192.168.127.29-PT-G7728 | PT-G7728 | In Progress ... |
| 192.168.127.31 | 192.168.127.31-PT-G503  | PT-G503  | In Progress ... |

6. If successful, a confirmation will be shown in the Status column.  
If unsuccessful, check the error description in the Status column to identify the issue. Click **Retry Failed Devices** to perform the action again.

### Reboot

## Create Snapshot

Use the **Snapshot** function to create a snapshot of the current configuration. The snapshot can be used to restore the configuration later.

- Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.

2. Select the device(s) to configure from the device list.

| Device Alias                                                 | Model     | Device IP      | MAC Address       | Firmware Version          | Location        |
|--------------------------------------------------------------|-----------|----------------|-------------------|---------------------------|-----------------|
| <input type="checkbox"/> 192.168.3.16-AWK-1161C              | AWK-1161C | 192.168.3.16   | 00:90:E8:11:61:C2 | v2.0 Build 2023_0417_0232 | a               |
| <input type="checkbox"/> 192.168.3.65-AWK-1165A              | AWK-1165A | 192.168.3.65   | 00:90:E8:11:65:49 | v2.0 Build 2023_0418_1026 |                 |

## Cybersecurity Controls

### Sticky MAC On/Off

Use the **Sticky MAC On/Off** function to enable or disable Sticky MAC for the selected device(s).

- Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.
- Select the device(s) to configure from the device list.

**MXview ONE** English admin

Select Operation

Device Configuration Device Control Cybersecurity Controls Run Script Web Console

| Device Alias                                                 | Model           | Device IP      | MAC Address       | Firmware Version          | Location        |
|--------------------------------------------------------------|-----------------|----------------|-------------------|---------------------------|-----------------|

Close

If unsuccessful, check the error description in the Status column to identify the issue. Click **Retry Failed Devices** to perform the action again.

## Disable Unused Ethernet and Fiber Ports

Use the **Disable Unused Ethernet and Fiber Ports** function to disable any unused Ethernet or fiber ports to make sure these ports cannot be exploited to gain unauthorized access to the device.

1. Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.
2. Select the device(s) to configure from the device list.

| Device Alias                                                 | Model           | Device IP      | MAC Address       | Firmware Version          | Location        |

## Disable Insecure HTTP and Telnet Console

Use the **Disable Insecure HTTP and Telnet Console** function to disable the non-secure HTTP and Telnet connection interfaces.

1. Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.
2. Select the device(s) to configure from the device list.

| Model        | The device model name.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Device IP    | The IP address of the device.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Accounts     | <p>The list of accounts associated with the device. Under certain conditions, the following statuses can show:</p> <ul style="list-style-type: none"> <li><b>Unable to retrieve accounts:</b> The device supports this feature, but MXview One was unable to successfully retrieve account information from the device.</li> <li><b>N/A:</b> MXview One cannot retrieve account information because the device does not support this feature.</li> </ul> |

Click **Refresh** at the top of the page to update the account information in the table.

## Editing Accounts on a Device

### NOTE

This function is only available for compatible devices. If the device is incompatible, this function will be greyed out.

- Navigate to **Menu** () > **Device Management** > **Account and Password**.
- Go to the **Account Management** tab.

3. Click the **Edit** (  ) icon next to the device account you want to edit.  
The **Account Management** window will appear.

**Account Management**

Operation \*  
Change Default "Admin" Name ▼

---

New Username \*  
Minimum 4 characters 0 / 64

New Password \*   
Minimum 8 characters 0 / 64

[Cancel](#) [Change](#)

4. To change the default admin account credentials:
  - a. Select **Change Default "Admin" Name** as the operation.
  - b. Specify the new username and password.
  - c. Click **Change**.
5. To add an account:
  - a. Select **Edit Account** as the operation.
  - b. Select the **Add Account** radio button.
  - c. Specify the username, password, and authority of the account.
  - d. Click **Add**.
6. To delete an account:
  - a. Select **Edit Account** as the operation.
  - b. Select the **Delete Account** radio button.
  - a. Enter the username of the account you want to delete.
  - b. Click **Delete**.

## Password Automation Overview

To access the **Account Management** page, in the function tree, navigate to **Menu** (  ) > **Device Management > Account and Password** and go to the **Password Automation** tab.

The **Password Automation** tab shows an overview of all user accounts on each device.

**Send Password Email**

## Resending the Password Email

### NOTE

This function is only available after completing the Password Automation Wizard at least once. Refer to [Running the Password Automation Wizard](#).

- Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
- Go to the **Password Automation** tab.
- In the **Password Automation** section, click **Resend Password Email**.
- When prompted, verify your MXview One account.  
The **Resend Password Email** screen will appear.

**Resend Password Email**

Are you sure you want to resend the device password to the following recipient(s)?  
1st Email: [redacted]

**Cancel** **Resend**

- Click **Resend**.  
MXview One will send an email with the device account credentials to the recipients specified in the Password Automation Wizard.

**Resend Password Email**

MXview One has sent the device account and password file to the following email address(es):  
1st Email: [redacted]

**Close**

## Configuring a Password Automation Schedule

With the password automation schedule function, you can configure a specific interval at which MXview One will generate new randomized passwords for all applicable devices.

## NOTE

This function is only available after completing the Password Automation Wizard at least once. Refer to [Running the Password Automation Wizard](#).

1. Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
2. Go to the **Password Automation** tab.
3. In the **Password Automation Schedule** section, configure the following settings:

Interval \* 90 30 - 365 Days  
Start Time \* AM 3:00  
Save

- **Interval:** Select the interval (in days) at which MXview One will randomize device passwords.
  - **Start Time:** Specify the day of time when MXview One will execute the password automation.
4. Click **Save**.

## Account Audit Overview

To access the **Account Audit** page, in the function tree, navigate to **Menu** (☰) > **Device Management** > **Account and Password** and go to the **Account Audit** tab.

The **Account Audit** tab lets users create a device account baseline and perform an account audit to easily identify newly added or deleted accounts.

| Deleted Accounts  | Shows the user accounts that were deleted compared to the baseline after performing an account audit.                                                                   |

## Creating an Account Baseline

1. Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
2. Go to the **Account Audit** tab.
3. The **Accounts Baseline** section includes the following information:

- **Last Executed:** Shows the date and time when the most recent baseline was created. If no baseline has been created before, this will show **N/A**.
4. Click **Create**.  
The **Device Baseline** window will appear.

5. Click **Create**.

## Executing a Manual Account Audit

### NOTE

This function is only available after creating an account baseline. Refer to [Creating an Account Baseline](#).

1. Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
2. Go to the **Account Audit** tab.
3. The **Accounts Audit** section shows the following information:

- **Last Audited:** Shows the date and time of the most recent account audit.
  - **Next Audit:** If automatic account auditing is enabled, this shows the time and date of the next scheduled audit.
4. Click **Audit**.  
MXview One will compare the current accounts to the baseline and will show any added or deleted accounts in the table.

## Configuring an Automatic Account Audit Schedule

### NOTE

This function is only available after creating an account baseline. Refer to [Creating an Account Baseline](#).

1. Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
2. Go to the **Account Audit** tab.
3. In the **Audit Automation** section, configure the following settings:

- **Enable:** Enable or disable the automatic account auditing function.
  - **Interval:** Specify the interval (in days) when MXview One will perform an account audit.
4. Click **Save**.

## Default Password Audit Overview

To access the **Default Password Audit** page, in the function tree, navigate to **Menu** (☰) > **Device Management** > **Account and Password** and go to the **Default Password Audit** tab.

The **Default Password Audit** tab lets users quickly check for any accounts that are using the default password.

This page displays the following information in a table format:

| Column                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Alias             | The unique name of the device.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Compatible               | Shows if the device supports MXview One retrieving account information.                                                                                                                                                                                                                                                                                                                                                                                |
| Model                    | The device model name.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Device IP                | The IP address of the device.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Default Account/Password | Shows if the account is using the default credentials: <ul style="list-style-type: none"><li>• <b>Yes:</b> The device uses the default username and password. For security reasons, it is highly recommended to change the default credentials.</li><li>• <b>No:</b> The device is not using the default credentials.</li><li>• <b>N/A:</b> MXview One cannot retrieve account information because the device does not support this feature.</li></ul> |

## Performing a Default Password Audit

1. Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
2. Go to the **Default Password Audit** tab.
3. In the **Default Password Audit** section, click **Scan**.  
The **Default Password Audit** window will appear.

4. Click **Scan**.  
MXview One will scan for any accounts using the default credentials and list them in the table.

## Temporary Accounts Overview

To access the **Temporary Accounts** page, in the function tree, navigate to **Menu** (☰) > **Device Management** > **Account and Password** and go to the **Temporary Accounts** tab.

The **Temporary Accounts** tab allows users to create, edit, and delete temporary accounts for devices.

This page displays the following information in a table format:

| Column       | Description                                                   |
|--------------|---------------------------------------------------------------|
| Device Alias | The unique name of the device.                                |
| Compatible   | Shows if the device supports the temporary accounts function. |
| Model        | The device model name.                                        |
| Device IP    | The IP address of the device.                                 |
| Username     | The username of the account.                                  |
| Start Time   | The account validity start time.                              |
| End Time     | The account validity end time.                                |
| Status       | The status of the account.                                    |

## Adding a Temporary Account

1. Navigate to **Menu** (☰) > **Device Management** > **Account and Password**.
2. Go to the **Temporary Accounts** tab.
3. Click the **Add** (+) icon next to the device you want to create a temporary account for.  
The **Add Temporary Account** window will appear.

## Deleting a Temporary Account

1. Navigate to **Menu** (  ) > **Device Management** > **Account and Password**.
2. Go to the **Temporary Accounts** tab.
3. Click the **Delete** (  ) icon next to the device you want to delete the temporary account of. The **Delete Temporary Account** window will appear.

4. Click **Delete**.  
MXview One will show the status of the account deletion.

A table titled "Delete Temporary Account" with a teal header. It displays the status of the account deletion for a specific device.

| Device Alias             | Model     | Device IP      | Status         |
|--------------------------|-----------|----------------|----------------|
| 192.168.127.11-EDS-GS16E | EDS-GS16E | 192.168.127.11 | In Progress... |

## 12. Saved CLI Scripts

The CLI Scripts function allows users to generate and execute CLI scripts from within MXview One. After creating and saving CLI scripts, users can create script automations and automation buttons to quickly execute batch configurations on multiple devices at once.

### Saved CLI Scripts Overview

To access the **Saved CLI Scripts** page, in the function tree, navigate to **Menu** (☰) > **Saved CLI Scripts**.

If there are no saved CLI scripts, a script will need to be created by clicking the **Add** (+) icon. Refer to [Adding a CLI Script](#) for information on how to create a script.

If there are saved CLI scripts, the following tabs will be available:

- **CLI Scripts:** This list shows all saved CLI scripts. From this table, you can create, edit, or delete CLI scripts.
- **Execution Results:** From this tab, you can download or delete the execution results of previously executed scripts.
- **Script Automation:** From this tab, you can view, create, edit, or delete script automations.
- **Automation Buttons:** Each script automation you create will generate an automation button. From this tab, you can manage script automation buttons.

|                          | Name            | Description            | Linked Scheduled Tasks | Linked Script Automations              |
|--------------------------|-----------------|------------------------|------------------------|----------------------------------------|
| <input type="checkbox"/> | reload-task     | reload-description     |                        | start-btn, diff_cli-btn, same_cli_btn1 |
| <input type="checkbox"/> | reload-task-new | reload-description-new |                        | diff_cli-btn, same_cli_btn2            |

# CLI Scripts

## Adding a CLI Script

1. Navigate to **Menu** (☰) > **Saved CLI Scripts** > **CLI Scripts**.

The **Saved CLI Scripts** screen will appear. A list of configured CLI scripts will show in the **CLI Scripts** list (if any).

2. Click the **Add** (+) icon.

The **Add CLI Script** screen will appear.

The 'Add CLI Script' form contains three input fields: 'Name \*' with a character count of '0 / 64', 'Description \*' with a character count of '0 / 255', and 'CLI Script' with a character count of '0 / 9999'. The 'CLI Script' field is a large text area. At the bottom right, there are 'Cancel' and 'Add' buttons.

3. Configure the following settings:
  - a. **Name**: Enter a name for the CLI script.
  - b. **Description**: Enter a description for the CLI script.
  - c. **CLI Script**: Enter the CLI command(s) to execute.

4. Click **Add**.

The CLI script will be added to the table.

The 'Saved CLI Scripts' screen shows a table with the following data:

|                          | Name                  | Description                | Linked Scheduled Tasks | Linked Script Automations              |
|--------------------------|-----------------------|----------------------------|------------------------|----------------------------------------|
| <input type="checkbox"/> | reload-task           | reload-description         |                        | start-btn, diff_cli-btn, same_cli_btn1 |
| <input type="checkbox"/> | reload-task-new       | reload-description-new     |                        | diff_cli-btn, same_cli_btn2            |
| <input type="checkbox"/> | Interface description | Show interface description |                        |                                        |

## Searching for a CLI Script

1. Navigate to **Menu** (☰) > **Saved CLI Scripts** > **CLI Scripts**.  
The **Saved CLI Scripts** screen will appear. A list of configured CLI scripts will show in the **CLI Scripts** list (if any).
2. In the **Search** (🔍) field, type the full or partial information of the CLI script.  
All CLI scripts matching the entered string will be shown in the table.

## Editing a CLI Script

1. Navigate to **Menu** (☰) > **Saved CLI Scripts** > **CLI Scripts**.  
The **Saved CLI Scripts** screen will appear. A list of configured CLI scripts will show in the **CLI Scripts** list (if any).
2. Click the **Edit** (✎) icon next to the script you want to edit.  
The **Edit CLI Script** screen will appear.

**Edit CLI Script**

Name \*  
Interface description  
21 / 64

Description \*  
Show interface description  
26 / 255

CLI Script  
show interfaces description  
27 / 9999

Cancel Apply

3. Configure the following settings:
  - a. **Name:** Enter a name for the CLI script.
  - b. **Description:** Enter a description for the CLI script.
  - c. **CLI Script:** Enter the CLI command(s) to execute.
4. Click **Apply**.  
A confirmation will appear to verify the CLI script was updated.

CLI script updated successfully

## Deleting a CLI Script

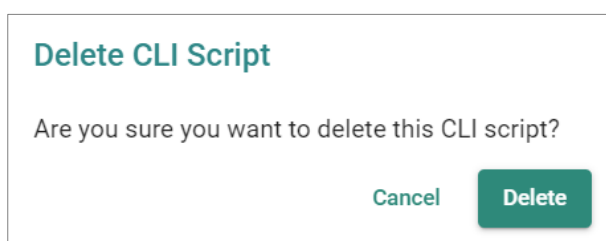

### NOTE

A CLI script cannot be deleted if it is linked to a scheduled task. To delete the script, modify or delete the scheduled task first on the **Administration > Maintenance Scheduler** page.

1. Navigate to **Menu** (☰) > **Saved CLI Scripts** > **CLI Scripts**.

The **Saved CLI Scripts** screen will appear. A list of configured CLI scripts will show in the **CLI Scripts** list (if any).

2. Click the **Delete** (🗑️) icon next to the CLI script you want to delete.  
A confirmation window will appear.

3. Click **Delete**.  
A confirmation will appear to verify the CLI script was deleted.

## Deleting Multiple CLI Scripts

### NOTE

A CLI script cannot be deleted if it is linked to a scheduled task. To delete the script, modify or delete the scheduled task first on the **Administration > Maintenance Scheduler** page.

1. Navigate to **Menu** (☰) > **Saved CLI Scripts** > **CLI Scripts**.

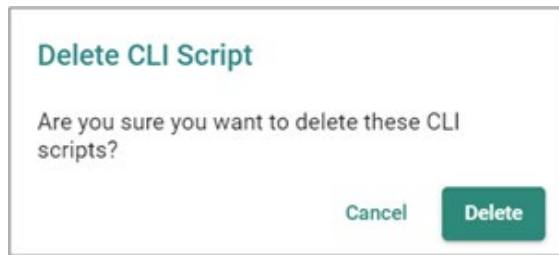

The **Saved CLI Scripts** screen will appear. A list of configured CLI scripts will show in the **CLI Scripts** list (if any).

2. Select the checkbox of the scripts you want to delete in the list.

3. Click the **Delete** (🗑️) icon at the top-left corner of the page.

4. A confirmation window will appear.

5. Click **Delete**.  
A confirmation will appear to verify the CLI script was deleted.

## Creating a CLI Script Scheduled Task

1. Navigate to **Menu** (☰) > **Administration** > **Maintenance Scheduler**.

The **Maintenance Scheduler** screen will appear.

2. Click the **Add (+)** icon.  
The **Add Job** screen will appear.

### Add Job

Job Name \*

Action \*  
Run Saved Script

CLI Script Name \*

Description \*  
0 / 200

Registered Devices \*

Repeat Execution \*  
Once

Start Date \*  
mm/dd/yyyy

Execution Time \*  
--:-- --

Cancel Add

3. Configure the following settings:
  - a. **Job Name:** Enter a name for the job.
  - b. **Action:** Select **Run Saved Script** from the Action drop-down list.
  - c. **CLI Script Name:** Select the CLI script that you want to execute.
  - d. **Description:** Enter a description for the job.
  - e. **Registered Devices:** Select the devices that you want to run the selected CLI script on.
  - f. **Repeat Execution:** Select the job execution frequency: Once, Daily, Weekly, Monthly.
  - g. **Start Date:** If you select **Once** in the Repeat Execution field, specify the start date to begin executing the scheduled job.
  - h. **On:** If you select **Weekly** or **Monthly** in the Repeat Execution field, specify when to begin executing the scheduled job.
  - i. **Execution Time:** Specify the time of day to run the scheduled job.
4. Click **Add**.  
MXview One will display the scheduled job in the Maintenance Scheduler table and will run the CLI script for the selected devices according to the defined schedule.

| Maintenance Scheduler                                        |          |                  |             |                   |                    |  |

# Execution Results

## Download All Execution Results

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.  
The **Saved CLI Scripts** screen will appear.
2. Go to the **Execution Results** tab.

3. Click **Download**.  
MXview One will download all the CLI script execution results as a ZIP file.

## Delete All CLI Script Execution Results

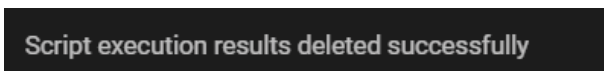

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.  
The **Saved CLI Scripts** screen will appear.
2. Go to the **Execution Results** tab.

3. Click **Delete**.  
A confirmation window will appear.

4. Click **Delete**.  
A confirmation will appear to verify all execution results have been deleted.

## Delete Execution Results Prior to a Specified Time

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.  
The **Saved CLI Scripts** screen will appear.
2. Go to the **Execution Results** tab.

3. Specify the **Date** and **Time**. All execution results prior to this time will be deleted.
4. Click **Delete**.  
A confirmation window will appear.

### Delete CLI Script Execution Results

Are you sure you want to delete all script execution results prior to 2024/07/22 12:00?

Cancel Delete

5. Click **Delete**.  
A confirmation will appear to verify all execution results have been deleted.

Script execution results deleted successfully

## Script Automation

From the **Script Automation** screen, you can create and manage script automations. A script automation allows you to combine multiple saved CLI scripts into a single script. A corresponding automation button then lets you quickly execute the included commands to the specified devices with just a single click.

### Adding a Script Automation

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.  
The **Saved CLI Scripts** screen will appear.
2. Go to the **Script Automation** tab.

- Click the **Add (+)** icon.

The **Add Script Automation** screen will appear.

The 'Add Script Automation' form contains the following fields and controls:

- Name \***: Text input field with a character count of 0 / 64.
- Description \***: Text input field with a character count of 0 / 255.
- CLI Scripts and Target Devices**: Section header.
- Affected Devices**: Section header.
- Affected Devices**: Dropdown menu.
- Buttons**: 'Cancel' and 'Add' buttons at the bottom right.

- Configure the following settings:
  - Name**: Enter a name for the script automation.
  - Description**: Enter a description for the script automation.
  - CLI Scripts and Target Devices**: Select the saved CLI script and devices to include in this automation. You can add a maximum of 50 scripts in a single script automation. This requires a previously created saved CLI script. Refer to the [Adding a CLI Script](#) section.

Click the **Add (+)** icon to add additional entries to the automation.

## NOTE

Only one saved CLI script can be assigned to an individual target device.

- Affected Devices**: Select the device(s) that will be affected by executing the CLI script(s) in the automation. A warning reminder with a list of affected devices will show when attempting to execute the automation button. If left blank, relevant devices will still be affected, but no warning will be shown in the Topology.

## NOTE

If the **Automation Button Display Mode** is set to **Panel**, devices affected by CLI script automations can be visually highlighted in the topology. Refer to [Previewing Affected Devices](#).

- Click **Add**.  
The script automation will be added to the table. Each script automation entry will also create an individual button in the Automation Buttons section. Refer to the [Automation Buttons](#) section.

The 'Saved CLI Scripts' table has tabs for 'CLI Scripts', 'Execution Results', 'Script Automation', and 'Automation Buttons'. The 'Script Automation' tab is active, showing a table with columns: Name, Description, and Affected Devices. A search bar is located at the top right of the table.

|                          | Name          | Description           | Affected Devices                                    |

## NOTE

MXview One supports a maximum of 200 script automations.

## Editing a Script Automation

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.  
The **Saved CLI Scripts** screen will appear.
2. Go to the **Script Automation** tab.
3. Click the **Edit** (✎) icon next to the script automation you want to edit.  
The **Edit Script Automation** screen will appear.

4. Configure the following settings:
  - **Name:** Enter a name for the script automation.
  - **Description:** Enter a description for the script automation.
  - **CLI Script and Target Devices:** Select the saved CLI script and device(s) to include in this automation. You can add a maximum of 50 scripts in a single script automation. This requires a previously created saved CLI script. Refer to the [Adding a CLI Script](#) section.  
  
Click the **Add** (+) icon to add additional entries to the automation.  
  
Click the **Delete** (🗑) icon to remove an entry.
  - **Affected Devices:** Select the device(s) that will be affected by executing the CLI script(s) in the automation. A warning reminder with a list of affected devices will show when attempting to execute the automation button. If left blank, relevant devices will still be affected, but no warning will be shown in the Topology.

## NOTE

If the **Automation Button Display Mode** is set to **Panel**, devices affected by CLI script automations can be visually highlighted in the topology. Refer to [Previewing Affected Devices](#).

5. Click **Apply**.  
A confirmation will appear to verify the script automation was updated

Updated successfully

## Deleting a Script Automation

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.
2. Go to the **Script Automation** tab.  
The **Script Automation** screen will appear. A list of configured script automation will show.
3. Click the **Delete** (🗑️) icon next to the script automation you want to delete.  
A confirmation window will appear.

4. Click **Delete**.  
A confirmation will appear to verify the CLI script was deleted.

## Deleting Multiple Script Automations

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.
2. Go to the **Script Automation** tab.  
The **Script Automation** screen will appear. A list of configured script automation will show in the CLI Scripts list (if any).
3. Select the checkbox of the script automations you want to delete in the list.
4. Click the **Delete** (🗑️) icon at the top of the page.

5. A confirmation window will appear.

6. Click **Delete**.  
A confirmation will appear to verify the script automations were deleted.

## Automation Buttons

From the **Automation Buttons** screen, you can manage automation buttons for configured script automations.

Each newly added automation script will automatically generate an automation button that is placed in the default Unnamed group.

## Setting the Automation Button Display Mode

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.
2. Go to the **Automation Buttons** tab.
3. Select the automation button display mode from the **Display Mode** drop-down list.
  - **Panel:** Show automation buttons in a panel format. This mode also allows you to preview devices affected by CLI script automations on the Topology screen. Refer to [Previewing Affected Devices](#).

- **Widget:** Show automation in a widget format. The widget size can be adjusted. Refer to [Changing the Automation Button Widget Size](#).

4. Click **Apply**.

## Configuring Automation Button Authentication Settings

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.
2. Go to the **Automation Buttons** tab.
3. Enable or disable the admin authentication using the **Require Admin Authentication** drop-down list.
  - **Enable:** Users need to enter the password of currently logged in account to execute the automation button.
  - **Disable:** Users can execute automation buttons without any authentication.
4. Click **Apply**.

## Editing an Automation Button Group

### NOTE

The interface elements may appear slightly different depending on the selected **Automation Button Display Mode**, but the process is the same for both view modes. The images in the instructions use **Widget** mode.

1. Navigate to **Menu** (☰) > **Saved CLI Scripts**.
2. Go to the **Automation Buttons** tab.

- Click the **Edit** (✎) icon in the top-left corner of the screen to enter edit mode.

- Click the **Edit** (✎) icon next to the group name of the group you want to edit.  
Widget mode:

Panel mode:

The **Edit Group** will appear.

Edit Group

Group Name \*  

7 / 64

Cancel

Apply

- Configure the following settings:
  - **Group Name:** Enter a name for the group.
  - **Reorder Buttons:** (For Widget mode only) Click and drag the buttons to adjust their position.
- Click **Apply**.  
The changes will appear on the **Automation Buttons** page.

- Click the **Save** (  ) icon to save your changes and leave edit mode.

- A confirmation will appear to verify the button group was updated.

If you leave the **Automation Buttons** page without saving, a confirmation window will appear.

## Editing an Automation Button

### NOTE

The interface elements may appear slightly different depending on the selected **Automation Button Display Mode**, but the process is the same for both view modes. The images in the instructions use **Widget** mode.

- Navigate to **Menu** (  ) > **Saved CLI Scripts**.
- Go to the **Automation Buttons** tab.
- Click the **Edit** (  ) icon in the top-left corner of the screen to enter edit mode.

- Click the **Edit** (  ) icon next to the button you want to edit.  
Widget home:

Panel mode:

The **Edit Button** window will appear.

### Edit Button

Test

Cancel Apply

5. Configure the following settings:
  - a. **State:** (For Panel mode only) Enable or disable the automation button.
  - b. **Background Color:** Click the value to open the color picker. Select the preferred background color on the color picker or enter the color's hex value.
  - c. **Text Color:** Click the value to open the color picker. Select the preferred text color on the color picker or enter the color's hex value.
  - d. **Group:** Select the group to assign this button to.
    - ☐ **Use the current group:** Leave the button in its currently assigned group.
    - ☐ **Create and add to a new group:** Create and assign the button to a new group.
    - ☐ **Move to another group:** Select an existing group to assign the button to.

- Click **Apply**.  
The changes will appear on the **Automation Buttons** page.

- Click the **Save** (  ) icon to save your changes and leave edit mode.

- A confirmation will appear to verify the button was updated.

If you leave the **Automation Buttons** page without saving, a confirmation window will appear.

## Creating an Automation Button Group

### NOTE

The interface elements may appear slightly different depending on the selected **Automation Button Display Mode**, but the process is the same for both view modes. The images in the instructions use **Widget** mode.

- Navigate to **Menu** (  ) > **Saved CLI Scripts**.
- Go to the **Automation Buttons** tab.

- Click the **Edit** (✎) icon in the top-left corner of the screen to enter edit mode.

- Click the **Create and add to a new group** (📁) icon in the top-left corner of the screen.

The **Create and add to a new group** window will appear.

The dialog box is titled 'Create and add to a new group' in teal. It contains two input fields: 'Group Name \*' with a character count '0 / 64' to its right, and 'Button Name \*' with a dropdown arrow to its right. At the bottom right, there are two buttons: 'Cancel' in teal and 'Create' in grey.

- Configure the following settings:
  - **Group Name:** Enter a name for the group.
  - **Button Name:** Select the button(s) to add to this group.
- Click **Create**.  
The changes will appear on the **Automation Buttons** page.

- Click the **Save** (  ) icon to save your changes and leave edit mode.

- A confirmation will appear to verify the button was updated.

If you leave the **Automation Buttons** page without saving, a confirmation window will appear.

## Changing the Automation Button Widget Size

### NOTE

This function is only available if the **Automation Button Display Mode** is set to **Widget**. Changes to the widget size will reflect on both the **Automation Buttons** and **Topology** pages.

- Navigate to **Menu** (  ) > **Saved CLI Scripts**.
- Go to the **Automation Buttons** tab.
- Click the **Edit** (  ) icon in the top-left corner of the screen to enter edit mode.

Click the **Widget Size** (  ) icon in the top-left corner of the screen.

The **Widget Size** window will appear.

4. Configure the following settings:
  - **Widget Size:** Select the size of the automation button widgets on the **Automation Buttons** and **Topology** pages.
  - **Align all groups in a single column:** Check to align automation button group widgets in a single column.
5. Click the **Save** (  ) icon to save your changes and leave edit mode

6. A confirmation will appear to verify the button was updated.

If you leave the **Automation Buttons** page without saving, a confirmation window will appear.

## Previewing Affected Devices

You can highlight any devices affected by CLI script automations in the topology screen. Only devices listed as Affected Devices of a script automation will be highlighted. Refer to [Adding a Script Automation](#).

### NOTE

This function is only available if the **Automation Button Display Mode** is set to **Panel**. Refer to [Setting the Automation Button Display Mode](#).

1. Navigate to **Menu** (☰) > **Topology**.
2. Hover over the automation button you want to execute. A hint message box will appear next to the button.
3. Click **more ...** to show a list of all affected devices.

4. Click **Preview in Topology** to highlight the affected devices in the topology.

- The affected devices will be highlighted in the topology. Click **Stop Preview** to close the preview.

# 13. Firmware Management

MXview One features Moxa Firmware Server integration to check for the availability of the latest firmware for devices. From the Firmware Management section, users can review the release notes, download the firmware file, and perform firmware updates for multiple devices at once.

## Firmware Management Overview

To access the Firmware Management page, in the function tree, navigate to **Menu** (☰) > **Firmware Management**.

On this page, users can find the **Check Firmware Status** function and a table with the firmware information of all model series in the topology.

| Model Series   | Device Status | Latest Version on the Firmware Server | Selected Version | Selected Firmware Download Status |
|----------------|---------------|---------------------------------------|------------------|-----------------------------------|
| EDS-408A       | Not updated   | v3.13                                 | None             |                                   |
| EDS-G4008      | Not updated   | v3.2                                  | None             |                                   |
| EDS-G512E-8PoE | Not updated   | v6.4                                  | None             |                                   |
| EDS-G516E      | Not updated   | v6.4                                  | None             |                                   |

### NOTE

Before using the Firmware Management function, make sure that the URL: <https://api.moxa-srs.thingsprocloud.com> and port 443 are allowed through the firewall.

## Check Firmware Status

**Check Firmware Status**

Moxa Firmware Server Status: ✔ Connected

Last Checked: 2023/12/28 AM 11:37:21

Check Interval: N/A

**Check Now** **Enable Check Interval**

The **Check Firmware Status** section includes the following the information:

- **Moxa Firmware Server Status:** This indicates the status of the MXview One connection to the Moxa Firmware Server.

- **Last Checked:** This is the date and time MXview One last checked the firmware information on the Moxa Firmware Server.
- **Check Interval:** If Check Interval is enabled, this shows the interval at which MXview One will check for firmware information. If no interval is configured, this will show "N/A".

There are two ways for MXview One to check for the firmware information on the Moxa Firmware Server:

- **Check Now:** Click **Check Now** to immediately check for updated firmware information.
- **Enable Check Interval:** Specify a time and date interval at which MXview One will check for new firmware information.

### Enable Check Interval

## Model Series Table Overview

The models table is divided into two separate tabs: **Models** and **Ignored Models**.

### Models

The **Models** tab shows an overview of all the model series and their respective firmware information. All identical models will be shown by a single representative entry in this table.

Models

Ignored Models

|  | Security patch available          | This icon indicates a new security patch is available for that model series.                                                                                                                                                                                |
|  | Enable new version notifications  | Click this icon to enable MXview One to check for and send notifications for new firmware versions for that model series.                                                                                                                                   |

## Ignored Models

The Ignored Models lists all models for which MXview One is not checking for new firmware and is not

sending notifications. To add a model series to the Ignored Models list, click the **bell** (  ) icon on the Models tab next to the model series.

|                                                                                     |                |  |

## Selecting a Firmware Version

Users can manually select a firmware version to upgrade to. When upgrading firmware, MXview One will apply the selected firmware to all similar models.

1. Navigate to **Menu** (☰) > **Firmware Management**.
2. Go to **Models** tab.
3. In the device list, click the **Select Firmware** (☰) icon of the corresponding model series in the Selected Version column.  
The **Select Firmware** window will appear.
4. Select a different firmware version from the Version drop-down menu. The release notes for the selected firmware version will appear in the section below.

**Select Firmware**  
Version  
6.4  

**Release Notes**  
Version  
6.4  
Change  
N/A  
Enhancement  
1. Added support for SFP auto-negotiation/forced mode CLI commands.  
2. Added a mechanism to prevent firmware downgrading to a version earlier than v6.2.  
Feature  
N/A  
Fix  
1. Login authentication fails when using MS-CHAPv2 with certain RADIUS servers.  
2. If the ring ports and coupling port are configured in a sequence (e.g. ports 1, 2, 3) and the coupling port is the last port in the sequence, the coupling link will not be established.  
Note  
1. Due to some changes to the components of the product, the device will be incompatible with certain older firmware versions. To ensure device stability, a mechanism has been added to prevent firmware downgrading to any version earlier than v6.2.

Cancel Select

5. Click **Select**.
6. MXview One will begin download the selected firmware.

7. The download progress will be shown in the Selected Firmware Download Status.

| <input type="checkbox"/> | Model Series | Device Status | Latest Version on the Firmware Server | Selected Version | Selected Firmware Download Status |
|--------------------------|--------------|---------------|---------------------------------------|------------------|-----------------------------------|
| <input type="checkbox"/> | EDS-G516E    | Not updated   | v6.4                                  | v6.4             | 100%                              |
| <input type="checkbox"/> | MDS-G4028    | Not updated   | v4.0                                  | None             |                                   |
| <input type="checkbox"/> | PT-7728-PTP  | Not updated   | v3.6                                  | None             |                                   |

# Upgrading Firmware

Once you have selected a firmware version and MXview One has finished downloading the firmware file, you can upgrade the firmware of the selected model series. To select and download a firmware version, refer to [Selecting a Firmware Version](#).

1. Navigate to **Menu** (  ) > **Firmware Management**.
2. Go to the **Models** tab.
3. In the device list, select the model series to upgrade firmware for.  
You can select multiple model series.
4. Click the **Upgrade Firmware** (  ) icon.
5. Configure the reboot sequence and execution time.

### Upgrade Sequence

Update Mode  
Smart Sequential ▼

| Order | IP             | Alias                    | Model Series | Current Version     | Selected Version |
|-------|----------------|--------------------------|--------------|---------------------|------------------|
| 1     | 192.168.127.11 | 192.168.127.11-EDS-G516E | EDS-G516E    | V6.3 build 23032200 | v6.4             |
| 2     | 10.123.32.40   | 10.123.32.40-MDS-G4028   | MDS-G4028    |                     | v4.0             |

Cancel Scheduled Upgrade Upgrade Now

- a. Select the reboot sequence:

- ☐ **Strict Sequential:** Upgrade the devices based on the device sequence in the topology starting from the device furthest away from the computer running MXview One, proceeding to the nearest one.
- ☐ **Smart Sequential:** Upgrade the devices based on the device sequence in the topology but simultaneously upgrade all devices in the same topology layer.

## NOTE

The computer running MXview One must be added to the topology in order for MXview One to determine the upgrade sequence. If the computer running MXview One is not added to the topology, you cannot select an update mode and MXview One will update the device firmware concurrently.

- b. Select an execution time:

- ☐ **Upgrade Now:** Click **Upgrade Now** to upgrade the devices instantly.
- ☐ **Scheduled Upgrade:** Click **Scheduled Upgrade** to create a new scheduled task. MXview One will upgrade the devices based on the specified time and date in the schedule.

6. To upgrade the devices instantly, click **Upgrade Now**. The system will execute the action.

### Firmware Upgrade Status

 The firmware upgrade may take some time. Please wait for the upgrade process to complete.

| Order | IP             | Alias                    | Model Series | Selected Version | Status      |
|-------|----------------|--------------------------|--------------|------------------|-------------|
| 1     | 10.123.32.40   | 10.123.32.40-MDS-G4028   | MDS-G4028    | v4.0             | Waiting     |
| 2     | 192.168.127.11 | 192.168.127.11-EDS-G516E | EDS-G516E    | v6.4             | In progress |

7. Click **Download CSV Report** or **Download PDF Report** to download a summary report of the firmware upgrade.

8. If the firmware upgrade was unsuccessful, check the error description in the Status column to identify the issue. Click **Retry Failed Devices** to perform the action again.

**Firmware Upgrade Result**

| Order | IP             | Alias                    | Model Series | Selected Version | Status   |
|-------|----------------|--------------------------|--------------|------------------|----------|
| 1     | 10.123.32.40   | 10.123.32.40-MDS-G4028   | MDS-G4028    | v4.0             | Failed   |
| 2     | 192.168.127.11 | 192.168.127.11-EDS-G516E | EDS-G516E    | v6.4             | Finished |

[Close](#) [Download CSV Report](#) [Download PDF Report](#) [Retry Failed Devices](#)

9. If you close this page without downloading the results report, a confirmation will appear. Clicking **Ignore** will delete the results report permanently.

**Ignore Report**

 **Are you sure you want to skip downloading the report?**

If you leave this page, the report will no longer be available for download.

## Baseline Management

The **Baseline Management** feature helps users detect whether a device's configuration and firmware settings have been modified.

### Baseline Overview

To access the **Baseline** page, in the function tree, navigate to **Menu (☰) > Baseline Management** and go to the **Baseline** tab. From this screen, users can create a device configuration and firmware baseline and perform a baseline audit to easily identify changes to device settings.

### Creating a Configuration and Firmware Baseline

1. Navigate to **Menu (☰) > Baseline Management**.
2. Go to the **Baseline** tab.

- In the Baseline section, click **Create**.  
The **Create Baseline** window will appear.

### Create Baseline

This will create a new baseline. The existing baseline (if any) will be overwritten.

Username  
admin

Password \*   
0/32

Cancel Create

- Enter the password of the currently logged in user.
- Click **Create**.  
MXview One will create a configuration and firmware baseline for all detected devices.

The page displays the following information in a table format:

| Column                              | Description                                                      |
|-------------------------------------|------------------------------------------------------------------|
| IP Address                          | The IP address of the device.                                    |
| Alias                               | The unique name of the device.                                   |
| Configuration Baseline Status       | Configuration baseline creation and audit record of the device.  |
| Firmware Baseline Status            | Firmware baseline creation and audit record of the device.       |
| Configuration Baseline Audit Status | The configuration baseline audit result of the device.           |
| Firmware Baseline Audit Status      | The firmware baseline audit result of the device.                |
| Firmware Version                    | The last audit date and baseline firmware version of the device. |

## Executing a Manual Baseline Audit

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

- Navigate to **Menu**  > **Baseline Management**.

2. Go to the **Baseline** tab.
3. In the Audit section, click **Audit**.
4. When prompted to confirm, click **Audit**.
5. MXview One will compare the current configuration and firmware version to the baseline and will show the audit result for each device in the table.

If scheduled auditing is enabled, the next scheduled audit date will be shown. Refer to [Configuring Scheduled Baseline Audits](#).

## Configuring Scheduled Baseline Audits

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. In the **Scheduled Audit** section, configure the following settings:

- **Enable:** Enable or disable scheduled auditing.
  - **Schedule Interval:** Specify the interval (in days) when MXview One will perform a baseline audit. The audit is always performed at 1 AM, based on the configured MXview One system time.
4. Click **Save**.

## Exporting the Baseline

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. Click the **Export** (📄) icon in the top-left corner.

4. Click **Export CSV**.  
MXview One exports all baseline data as a CSV file.

## Searching the Baseline Data

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. In the **Search** (🔍) field, type the full or partial information.  
All items matching the entered string will be shown in the table.

## Comparing Configuration Files

Use the **Compare Configuration** feature to compare changes between the current device configuration and baseline configuration.

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. Click the **Compare configuration** (🔍) icon next to the device you want to compare configurations for.  
The **Compare configuration** screen will appear and show a comparison between the current device

| Compare configuration                |                                                                 | Side by Side Line by Line |                                                                 |
|--------------------------------------|-----------------------------------------------------------------|---------------------------|-----------------------------------------------------------------|
| Only Show Lines with Differences (0) |                                                                 |                           |                                                                 |
| 1                                    | moxa# show running-config                                       | 1                         | moxa# show running-config                                       |

- ## Executing a Manual Baseline Audit on Selected Devices

 **NOTE** This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

- ## MXview One 1.7.0 User Manual

- a. Click the **Run audit** (🔍) icon of the device you want to perform the audit for.

4. To perform a manual baseline audit on multiple devices:
  - a. Check the checkbox of the devices you want to perform the audit for.
  - b. Click the **Run audit** (🔍) icon in the top-left corner of the table.

5. MXview will compare the current device configuration with the baseline configuration. The result (match or mismatch) will show in the table.

## Setting the Current Configuration and Firmware as the New Baseline

This function allows users to set the current configuration and firmware of one or more devices as the new baseline for those devices. This action will overwrite any existing baseline for the selected device(s).

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. To set the current configuration and firmware as the baseline for a single device:
  - a. Click the **Set current configuration and firmware as baseline** (🔍) icon of the device you want to update the baseline for.

The **Set New Baseline** window will appear.

- b. When prompted, enter the account credentials of the currently logged in users.
- c. Click **Set**.
4. To set the current configuration and firmware as the baseline for multiple devices:
  - a. Check the checkbox of the devices you want to update the baseline for.
  - b. Click the **Set current configuration and firmware as baseline** (🔧) icon in the top-left corner of the table.

The **Set New Baseline** window will appear.

- c. When prompted, enter the account credentials of the currently logged in user.
- d. Click **Set**.
5. MXview One will update the baseline with the current device configuration and firmware version.

## Restoring Devices to the Baseline Settings

This function allows users to restore the device configuration and firmware to the baseline configuration and firmware version.

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. Click the **Restore to baseline configuration** (↺) icon of the device you want to restore to the baseline configuration and firmware.

The **Restore to Baseline Configuration** window will appear.

4. When prompted, enter the account credentials of the currently logged in user.
5. Click **Restore**.
6. MXview One will restore the current device configuration and firmware to the baseline version.

## Removing Device(s) from the Baseline

### NOTE

This function is only available after creating a configuration and firmware baseline. Refer to [Creating a Configuration and Firmware Baseline](#).

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Baseline** tab.
3. To remove a single device from the baseline:
  - a. Click the **Remove device from baseline** (🗑️) icon of the device you want to remove.

4. To remove multiple devices from the baseline:
  - a. Check the checkbox of the devices you want to remove.
  - b. Click the **Remove device from baseline** (🗑️) icon in the top-left corner of the table.

5. MXview One will move the device(s) to the **Not in Baseline** tab. Audits and baseline actions will no longer apply to these devices. Refer to **Not in Baseline Overview**.

# Not in Baseline Overview

To access the **Not in Baseline** page, in the function tree, navigate to **Menu** (☰) > **Baseline Management** and go to the **Not in Baseline** tab. This screen shows any devices that are not included in the baseline. Baseline auditing actions do not apply to these devices.

## Searching the Not in Baseline Data

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Not in Baseline** tab.
3. In the **Search** (🔍) field, type the full or partial information.  
All items matching the entered string will be shown in the table.

## Adding Device(s) to the Baseline

1. Navigate to **Menu** (☰) > **Baseline Management**.
2. Go to the **Not in Baseline** tab.
3. To add a single device to the baseline:
  - a. Click the **Add device to baseline** (📌+) icon of the device you want to add.

4. To add multiple devices to the baseline:
  - a. Check the checkbox of the devices you want to add.
  - b. Click the **Add device to baseline** (📌+) icon in the top-left corner of the table.

5. MXview will move the device(s) to the **Baseline** tab. Refer to **Baseline Overview**.

# 15. Events and Notifications

MXview One allows you to monitor system events, create custom monitoring events, and configure event notifications.

## Event Monitoring

### Viewing System Events

To access the **System** page, in the function tree, navigate to **Menu** (☰) > **Event Management** > **Event History** and go to the **System** tab. The **System** tab shows information about MXview One system events. Use the filters to customize the information displayed in the table. You can also export the data as a CSV file.

|                          | ID  | Source     | Username | Source IP | Device Alias | Description                   | Time Issued         |
|--------------------------|-----|------------|----------|-----------|--------------|-------------------------------|---------------------|
| <input type="checkbox"/> | 661 | MXview One | admin    |           |              | User login: admin             | 2025-11-21 09:52:59 |
| <input type="checkbox"/> | 660 | MXview One | admin    |           |              | User login: admin             | 2025-11-21 09:35:55 |
| <input type="checkbox"/> | 657 | MXview One | admin    |           |              | User login: admin             | 2025-11-21 09:29:17 |
| <input type="checkbox"/> | 651 | MXview One |          |           |              | Unknown event type: 268435546 | 2025-11-21 06:56:33 |

1. Navigate to **Menu** (☰) > **Event Management** > **Event History**.
2. Go to the **System** tab.

The **System** tab will display the following information in a table format:

| Column       | Description                                           |
|--------------|-------------------------------------------------------|
| Acknowledge  | Acknowledge status of the event                       |
| Show Details | The detailed information of this event                |
| ID           | The unique identifier of the event                    |
| Source       | The source of the event                               |
| Username     | The username of the account associated with the event |
| Source IP    | The IP address of the device that issued the event    |
| Device Alias | The unique name of the device                         |
| Description  | The description of the event                          |
| Time Issued  | The time the event was issued                         |

3. To filter the information in the table by specific criteria:
  - a. Click the **Filter** (☰) icon in the top left corner.  
The following screen will appear.

- b. Specify any of the following criteria:

| Criteria    | Description                                                   |
|-------------|---------------------------------------------------------------|
| Acknowledge | Select the acknowledgement status of the event                |
| Start Date  | Specify the start date and time for the event data to display |
| End Date    | Specify the end date and time for the event data to display   |

- c. Click **Apply**.  
MXview One filters the table to only display events that match the specified criteria.
4. To sort the data in the table by a specific column, click the column heading.  
MXview One sorts the table by the column.
5. To export data displayed on the **System** tab:
  - a. Click the **Export** (📄) icon.

- b. Select **Export CSV** for just the events on the first page or **Export All Events to CSV** for all event pages.  
MXview One exports the displayed event data as a CSV file.

## Viewing Network and Device Events

To access the **Network and Device** page, in the function tree, navigate to **Menu** (☰) > **Event Management** > **Event History** and go to the **Network and Device** tab.

The **Network and Device** tab shows information about all the network and device events in your topology. Use the filters to customize the information displayed in the table. You can also export the data as a CSV file.

|                          | ID  | Source     | Username | Source IP       | Device Alias             | Description                          | Time Issued         |
|--------------------------|-----|------------|----------|-----------------|--------------------------|--------------------------------------|---------------------|
| <input type="checkbox"/> | 665 | Trap       |          | 192.168.123.163 | 192.168.123.163-EDS-510E | Failed to authenticate device login. | 2025-11-21 09:54:55 |
| <input type="checkbox"/> | 664 | Trap       |          | 192.168.123.163 | 192.168.123.163-EDS-510E | Account authentication failed        | 2025-11-21 09:54:55 |
| <input type="checkbox"/> | 663 | MXview One |          | 192.168.123.153 | 192.168.123.153-EDS-405A | Device ICMP reachable                | 2025-11-21 09:54:44 |
| <input type="checkbox"/> | 662 | MXview One |          | 192.168.123.153 | 192.168.123.153-EDS-405A | Device ICMP unreachable              | 2025-11-21 09:54:40 |

The page will display the following information in a table format:

| Column       | Description                                           |
|--------------|-------------------------------------------------------|
| Acknowledge  | The acknowledgement status of the event.              |
| Show Details | Detailed information about the event.                 |
| ID           | The unique identifier of the event                    |
| Source       | The source of the event.                              |
| Username     | The username of the account associated with the event |
| Source IP    | The IP address of the device that issued the event.   |
| Device Alias | The unique name of the device.                        |
| Description  | The description of the event.                         |
| Time Issued  | The date and time the event was issued.               |

1. Navigate to **Menu (☰) > Event Management > Event History**.
2. Go to the **Network and Device** tab.  
The **Network and Device** screen will appear:
3. To filter the information in the table according to specific criteria:
  - a. Click the **Filter (≡)** icon in the top-left corner.  
The filter window will appear.

- b. Specify any of the following criteria:
  - ☐ Severity: Select the severity level of the event.
  - ☐ Group: Select the group the device is assigned to.
  - ☐ IP Address: Specify the IP address of the device.
  - ☐ Source: Select the source of the event.
  - ☐ Acknowledge: Select the acknowledgement status of the event.
  - ☐ Start Date: Specify the start date and time for which to display event data.
  - ☐ End Date: Specify the end date and time for which to display event data.

- c. Click **Apply**.
4. To sort the data in a specific column, click the column header.
5. To acknowledge all events:
  - a. Click the **Ack All Events** (✉) icon in the top-left corner.  
The **Ack All Events** screen will appear.

- b. When prompted to confirm, click **Apply**.  
MXview One will acknowledge all events displayed in the table.
6. To delete all events:
  - a. Click the **Clear All Events** (🗑) icon in the top-left corner.  
The **Clear All Events** screen will appear.

- b. When prompted to confirm, click **Apply**.  
MXview One will delete all events displayed in the table
7. To export data displayed on the **Network and Device** tab:
  - a. Click the **Export** (+) icon.

- b. Click **Export CSV** to only export the events on the first page or **Export All Events to CSV** to export all events.  
MXview One exports the displayed event data as a CSV file.

## Configuring Event Thresholds and Severity Levels

Use the **Preferences** and **Global Device Settings** screen to configure default event thresholds and severity levels.

1. Navigate to **Menu** (☰) > **Administration** > **Preferences**.  
The **Preferences** screen will appear.
2. In the **Advanced** section, expand **Events**.  
The **Events** settings will appear.

**Advanced**

Events

Link Up \*  
Information

Link Down \*  
Critical

Port Looping \*  
Warning

Save

3. Select one of the following severity levels for **Link Up** events:
  - **Information**
  - **Warning**
  - **Critical**
4. Select one of the following severity levels for **Link Down** events:
  - **Information**
  - **Warning**
  - **Critical**
5. Select one of the following severity levels for **Port Looping** events:
  - **Information**
  - **Warning**
  - **Critical**
6. Click **Save**.  
MXview One will update the event severity settings.
7. Navigate to **Menu** (☰) > **Administration** > **Global Device Settings**.  
The **Global Device Settings** screen will appear.

## NOTE

Once you save the settings in the Global Device Settings section, the settings will synchronize to each device in the topology.

8. To trigger events when network bandwidth utilization exceeds a threshold:
  - a. Select **Enabled** from the first **Bandwidth Utilization Over** drop-down list.

Bandwidth Utilization Over  
Enabled

Bandwidth Utilization Over  
0 %

Severity  
Warning

- b. Specify the percentage of bandwidth utilization for the threshold.

Bandwidth Utilization Over  
Enabled

Bandwidth Utilization Over  
0

Severity  
Warning

- c. Select the **Severity** level for the event.
9. To trigger events when network bandwidth utilization falls below a threshold:
  - a. Select **Enabled** from the first **Bandwidth Utilization Under** drop-down list.

Bandwidth Utilization Under  
Enabled

Bandwidth Utilization Under  
0

Severity  
Warning

- b. Specify the percentage of bandwidth utilization for the threshold.

Bandwidth Utilization Under  
Enabled

Bandwidth Utilization Under  
0

Severity  
Warning

- c. Select the **Severity** level for the event.
10. To trigger events when the packet error rate exceeds a threshold:
  - a. Select **Enabled** from the first **Packet Error Rate Over** drop-down list.

Packet Error Rate Over  
Enabled

Packet Error Rate Over  
0

Severity  
Warning

- b. Specify the packet error rate for the threshold.

Packet Error Rate Over  
Enabled

Packet Error Rate Over  
0

Severity  
Warning

- c. Select the **Severity** level for the event.
11. To trigger events when the SFP TX value is below a certain threshold:

- a. Select **Enabled** from the first **SFP TX Under** drop-down list.

SFP TX Under  
Enabled

SFP TX Under \*  
0  
-100 - 0 dBm

Severity \*  
Warning

- b. Specify the SFP TX threshold level.

SFP TX Under  
Enabled

## NOTE

If the threshold is set as '0', the threshold function will be disabled.

16. Click **Save**.
- MXview One will update the event threshold settings.

# Notification Methods

MXview One supports email notifications for events. The notification method requires specific server configurations.

## Configuring Email Server Settings

Use the **System Settings** screen to configure an email server to send email notifications for event notifications.

1. Navigate to **Menu** (☰) > **Administration** > **System Settings**.  
The **System Settings** screen will appear.
2. Find the **Email Server Configuration** section.
3. Configure the following:
  - **Server Domain Name/IP**
  - **Port number**
  - **Encryption**
  - **Allow Self-signed Certificate**
  - **Username**
  - **Password**
  - **Sender Address**
4. Click **Save**.  
MXview One can send email messages for configured event notifications.

## Notification Management

The **Notification Management** screen allows you to configure event notifications by issuing a registered action (e.g., sending an email message to a specified recipient) when configured events are detected on your network.

## Configuring New Event Notifications

MXview One event notifications require at least one registered action (e.g., sending an email message to a specified recipient), which MXview One performs when a specified event is detected on your network.

1. Navigate to **Menu** (☰) > **Notification Management**.

The **Notification Management** screen appears.

2. To register an action:

- a. Click the **Notification Output** tab.

The **Notification Output** tab displays a list of registered actions (if any).

The screenshot shows the 'Notification Management' interface with the 'Notification Output' tab selected. It features a table with columns: Name, Type, and Information. A single entry is listed with the name 'Test', type 'Email', and information 'email@example.com'. There are icons for adding (+), editing (pencil), and deleting (trash) actions. A search bar is located at the top right. The bottom right corner indicates '1 - 1 of 1'.

|                          | Name | Type  | Information       |
|--------------------------|------|-------|-------------------|
| <input type="checkbox"/> | Test | Email | email@example.com |

- b. Click the **Add** (+) icon in the top-left corner.

The **Add Notification Output** screen will appear.

The screenshot shows the 'Add Notification Output' form. It has three required fields: 'Name \*' (with a character count of 0 / 63), 'Type \*' (a drop-down menu), and 'Information \*' (with a character count of 0 / 64). At the bottom right, there are 'Cancel' and 'Add' buttons.

- c. In the **Name** field, type a name to describe the action.
- d. From the **Type** drop-down list, select one of the following actions:
  - ☐ **E-mail:** Sends an email to the specified email address.
  - ☐ **Microsoft Teams:** Sends a message through Microsoft Teams.
  - ☐ **Message Box:** Displays a message box when the event occurs.

- e. Provide additional information required for the action (if any).

- f. Click **Add**.

The registered action appears in the table on the **Notification Output** tab.

3. To add a new event notification:

- a. Click the **Notification Setting** tab.

The **Notification Setting** tab displays a list of configured event notifications (if any).

- b. Click the **Add** (+) icon in the top-left corner.  
The **Create Notification** screen appears.

### Create Notification

Notification Name \*

Event \*

Registered Devices \*

Registered Outputs \*

Cancel
Add

- c. In the **Notification Name** field, type a name to describe the event notification.
- d. From the **Event** drop-down list, select the event type.
- e. From the **Registered Devices** drop-down list, select the network device(s) you want to monitor.
- f. From the **Registered Outputs** drop-down list, select the action that MXview One performs when the specified event is detected on the previously selected device(s).
- g. Click **Add**.  
The event notification appears in the table on the **Notification Setting** tab.

## Adding a Microsoft Teams Action

Use the **Notification Output** tab on the **Notification Management** screen to add a Microsoft Teams notification action.

1. In Microsoft Teams, go to the channel you want to add the incoming webhook to.

2. Click **More options (...)** next to the channel name.

3. Select **Manage channel**.

4. In the **Connectors** section on the **Settings** tab, click the **Edit** button.

5. Search for **Incoming Webhook** and click the **Configure** button.  
The **Incoming Webhook** will appear.

6. Enter a name for the webhook and upload a custom icon (optional), then click **Create**.

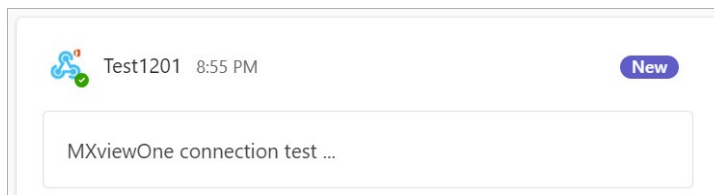

7. Copy the URL shown in the pop-up window to your clipboard and click **Done**.
8. In MXview One, navigate to **Menu (☰) > Notification Management**.
9. Click the **Notification Output** tab.
10. Click the **Add (+)** icon in the top-left corner.  
The **Add Notification Output** screen will appear.
11. In the **Name** field, enter a descriptive name for action.
12. From the **Type** drop-down menu, select **Microsoft Teams**.
13. In the **Webhook** field, paste the webhook URL copied from the Microsoft Teams.

14. Click **Test Connection** to verify the webhook works properly.

If successful, you will receive a message in the linked Microsoft Teams channel.

15. Click **Add**.  
The registered action appears in the table on the **Notification Output** tab.

## Editing or Exporting Registered Actions

Use the **Notification Output** tab on the **Notification Management** screen to edit registered actions or export a CSV file containing registered action information.

1. Navigate to **Menu** (☰) > **Notification Management**.  
The **Notification Management** screen will appear.
2. Click the **Notification Output** tab.  
The **Notification Output** tab displays a list of registered actions.
3. To edit a registered action:
  - a. Click the **Edit** (✎) icon next to the action you want to edit.  
The **Edit Notification Output** screen will appear.

- b. Modify the following settings:
  - ☐ Name
  - ☐ Type

- ☐ Information
- c. Click **Apply**.  
The **Notification Output** screen appears and displays the updated action information.
- 4. To export data displayed on the **Notification Output** tab:
  - a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.  
MXview One exports the displayed action data as a CSV file.

## Editing or Exporting Notification Configurations

Use the **Notification Setting** tab on the **Notification Management** screen to edit configured notifications or export a CSV file containing notification configuration information.

1. Navigate to **Menu** (☰) > **Notification Management**.  
The **Notification Management** screen will appear.
2. Click the **Notification Setting** tab.  
The **Notification Setting** tab displays a list of configured notifications.
3. To edit a notification:
  - a. Click the **Edit** (✎) icon next to the notification you want to edit.  
The **Edit Notification** screen will appear.

 A screenshot of the 'Edit Notification' form. It contains the following fields:
 

- Notification Name \***: Text input field with 'Test' entered.
- Event \***: Dropdown menu with 'Device ICMP unreachable' selected.
- Registered Devices \***: Dropdown menu with 'All devices' selected.
- Registered Outputs \***: Dropdown menu with 'Test' selected.
- Content**: Text area with a character count '0 / 2000' at the bottom right.
- Buttons**: 'Cancel' and 'Apply' buttons at the bottom right.

- b. Modify the following settings:
  - ☐ Notification Name
  - ☐ Event
  - ☐ Registered Devices
  - ☐ Registered Outputs
- c. Click **Apply**.  
The **Notification Setting** screen appears and displays the updated notification information.

4. To export data displayed on the **Notification Setting** tab:

- a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.

MXview One exports the displayed notification data as a CSV file.

## Custom Event Management

To access the **Custom Event** tab, in the function tree, navigate to **Menu** (☰) > **Event Management** > **Event Settings** and go to the **Custom Event** tab.

The **Custom Event** screen provides information about all the custom events configured on MXview One. You can use the **Custom Event** tab to view whether a custom event is enabled or disabled, modify a custom event, or export custom event configurations as a CSV file.

## Configuring Custom Events

The **Custom Event** tab allows you to define your own events to monitor with flexible detection thresholds, severity levels, and duration times.

1. Navigate to **Menu** (☰) > **Event Management** > **Event Settings**.
2. Go to the **Custom Event** tab.  
The **Custom Event** screen will appear.
3. Click the **Add** (+) button in the top-left corner of the screen.  
The **Add Custom Event** screen will appear.

### Add Custom Event

Enable Custom Event \*

Enabled

Severity \*

Device Properties \*

Condition Operator \*

Condition Value \*

Description

Add

4. Select the default event status:
  - **Enabled:** MXview One monitors the event
  - **Disabled:** MXview One does not monitor the event
5. Select one of the following severity levels for the event:
  - Information
  - Warning
  - Critical
6. Click the **Device Properties** and select the device property to monitor.
7. Configure the following threshold criteria:
  - **Condition Operator:** Select the criteria operator for matching the condition value
  - **Condition Value:** Specify the value for the criteria operator to match
8. (Optional) In the **Description** field, type a string (up to 250 characters in length) to describe the custom monitoring.
9. (Optional) In the **Recovery Description** field, type a string (up to 250 characters in length) to describe how to recover from the event.
10. In the **Duration** field, users can specify how many times an event can happen without any action being taken. If the number of times the event happens exceeds the **Duration**, then MXview One will send an alert.
11. From the **Register Devices** drop-down list, select the devices to monitor for the custom event.
12. Click **Add**.

The custom event appears in the **Custom Event** table.

## NOTE

If the threshold is set as '0', the threshold function will be disabled.

## Viewing or Exporting Custom Event Settings

1. Navigate to **Menu** (☰) > **Event Management** > **Event Settings**.
2. Go to the **Custom Event** tab.

The **Custom Event** screen will appear and displays the following information in a table format:

| Column               | Description                                                |
|----------------------|------------------------------------------------------------|
| Event Name           | The name of the event                                      |
| Enabled/Disabled     | The monitoring status of the event                         |
| Condition            | The threshold criteria configured for the event            |
| Description          | The description of the event                               |
| Recovery Description | The recovery description of the event                      |
| Duration             | The number of times of consecutive pollings for the event  |
| Registered Devices   | The number or registered devices that the event applies to |

3. To search for information in the table, type a full or partial string that matches the value in any of the table columns.  
MXview One filters the table to only display events with values that fully or partially match the specified string.
4. To filter the information in the table by event severity, click one of the color-coded severity levels in the left-side panel.

MXview One filters the table to only display events that match the selected severity level.

5. To sort the data in the table by a specific column, click the column heading.  
MXview One sorts the table by the column.

6. To export data displayed on the **Custom Event** tab:

- a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.

MXview One exports the displayed event data as a CSV file.

## Enabling/Disabling or Editing Custom Events

To enable or disable a custom event, edit the custom event settings.

1. Navigate to **Menu** (☰) > **Event Management** > **Event Settings**.
2. Go to the **Custom Event** tab.

The **Custom Event** screen will appear and display a list of configured custom events.

3. Click the **Edit** (✎) icon next to the event you want to enable/disable.

The **Update Custom Event** screen will appear.

A screenshot of the 'Update Custom Event' screen. It contains several form fields: 'Enable Custom Event \*' with a dropdown menu set to 'Enabled'; 'Severity \*' with a dropdown menu set to 'Critical'; 'Device Properties \*' with a text field containing 'DslLed1'; 'Condition Operator \*' with a dropdown menu set to 'Over' and 'Condition Value \*' with a text field containing '10'; 'Description' with a text field containing 'The DslLed1 is over 10.'; 'Recovery Description' with a text field containing 'Recovery' and a character count '23 / 250'; 'Duration \*' with a text field containing '1' and a character count '8 / 250'; and 'Registered Devices \*' with a dropdown menu set to 'All devices' and a label 'Consecutive Pollings'. At the bottom right, there are 'Cancel' and 'Apply' buttons.

4. From the **Enable Custom Event** drop-down list, select one of the following:

- **Enabled**
- **Disabled**

5. Modify any additional event settings you wish to change.

6. Click **Apply**.

The **Custom Event** screen will appear and display the updated event information.

### NOTE

If the threshold is set as '0', the threshold function will be disabled.

# Syslog Settings

MXview One features a built-in syslog server to receive and log syslog events from devices. Users can also define filtering rules, allowing MXview One to forward syslog events that match these rules to one or multiple external syslog servers.

## Enabling/Disabling the Built-in Syslog Server

1. Navigate to **Menu** (☰) > **Event Management** > **Syslog Settings**. The **Syslog Settings** screen appears.
2. Go to the **Syslog Server Settings** tab.

The screenshot shows the 'Syslog Settings' interface with the 'Syslog Server Settings' tab selected. It contains the following fields and options:

- Built-in Syslog Server \***: A dropdown menu currently set to 'Disabled'.
- UDP Port \***: A text input field with '514' entered. Below it is a range indicator '1 - 65535'.
- TCP Port \***: A text input field with '5143' entered. Below it is a range indicator '1 - 65535'.
- Authentication \***: A dropdown menu currently set to 'Disabled'.
- A green **Save** button is located at the bottom right of the form area.

3. To enable the syslog server:
  - a. In the **Built-in Syslog Server** field, select a syslog mode.
    - ☐ **Enable (UDP only)**: Enable the syslog server and restrict it to UDP only.
    - ☐ **Enable (TCP only)**: Enable the syslog server and restrict it to TCP only.
    - ☐ **Enable (UDP & TCP)**: Enable the syslog server and make it accessible via TCP and UDP.
  - b. Specify the syslog server's UDP port. The default port number is 514.
  - c. Specify the syslog server's TCP port. The default port number is 5143.
  - d. Select an authentication mode:
    - ☐ **Disabled**: Do not require authentication.
    - ☐ **TLS only**: Use TLS authentication.
    - ☐ **TLS + certificate**: Use a combination of TLS and certificates for authentication.
  - e. Click **Save**.

### NOTE

If you selected **TLS + certificate** as the authentication method, the **Download and manage certificates from the MXview One Control Panel** message will show. Click the link to go to MXview One Control Panel for managing the syslog server certificate.

4. To disable the syslog server:
  - a. In the **Built-in Syslog Server** field, select **Disabled**.
  - b. Click **Save**.

## Viewing Syslog Events

Use the **Syslog Viewer** tab on the **Syslog Settings** screen to view information about syslog events on your network. Use the filters to customize the information displayed in the table. You can also export the data as a CSV file.

1. Navigate to **Menu** (☰) > **Event Management** > **Syslog Settings**.  
The **Syslog Settings** screen appears.
2. Go to the **Syslog Viewer** tab.  
The **Syslog Viewer** screen displays the following information in a table format:

| Column     | Description                                        |
|------------|----------------------------------------------------|
| Severity   | The severity of the event                          |
| Time Stamp | The time the event was issued                      |
| IP Address | The IP address of the device that issued the event |
| Facility   | The group the device is assigned to                |
| Message    | The description of the event                       |

3. To search the information in the table, type a full or partial string that matches the value in any of the table columns.  
MXview One searches the table to only display results that fully or partially match the specified string.
4. To filter the information in the table by specific criteria:
  - a. Click the **Filter** (≡) icon in the top-left corner.  
The following screen will appear.

- b. Specify any of the following criteria:

| Criteria   | Description                                                                                                                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | Specify the IP address of the device that issued the event                                                                                                                                                               |
| Facility   | Select the group to which the device is assigned                                                                                                                                                                         |
| Priority   | Select the criteria operator for matching the event severity level: <ul style="list-style-type: none"> <li>• <b>Higher than or equal to</b></li> <li>• <b>Equals</b></li> <li>• <b>Lower than or equal to</b></li> </ul> |
| Severity   | Select the severity level of the event                                                                                                                                                                                   |
| Start Date | Specify the start date and time for the event data to display                                                                                                                                                            |
| End Date   | Specify the end date and time for the event data to display                                                                                                                                                              |

- c. Click **Apply**.

MXview One filters the table to only display events that match the specified criteria.

5. To sort the data in the table by a specific column, click the column heading.  
MXview One sorts the table by the column.
6. To export data displayed on the **Syslog Viewer** screen:
  - a. Click the **Export** (📄) icon.

- b. Select **Export CSV** for just the first syslog page or **Export All Syslog to CSV** for all syslog pages.  
MXview One exports the displayed syslog data as a CSV file.
7. To clear all syslog data, click the **Clear All Events** (🗑️) icon.  
MXview One clears all syslog data on the **Syslog Viewer** screen.

## Enabling/Disabling Syslog Forwarding

From the **Syslog Forwarding** tab on the **Syslog Settings** screen, you can enable or disable the syslog forwarding function and define the filtering rules. MXview One will act as a syslog forwarder and forward the syslog events that match the configured rules to one or multiple external syslog servers.

A screenshot of the 'Syslog Settings' screen, specifically the 'Syslog Forwarding' tab. The screen has a header 'Syslog Settings' and three sub-tabs: 'Syslog Server Settings', 'Syslog Viewer', and 'Syslog Forwarding' (which is active). The main content area includes: a 'Syslog Forwarding \*' dropdown set to 'Disabled'; a 'Protocol \*' dropdown set to 'UDP'; two rows for 'Remote IP/Domain Name' and 'Port', each with a text input field and a range '0 / 253' and '1 - 65535'; a 'Syslog Filters (1/128)' section with a '+' icon, a 'Source IP \*' dropdown set to 'Any IP', and a 'Severity \*' dropdown set to 'All'; and a green 'Save' button at the bottom left.

1. Navigate to **Menu** (☰) > **Event Management** > **Syslog Settings**.  
The **Syslog Settings** screen appears.
2. Go to the **Syslog Forwarding** tab.
3. To enable syslog forwarding:
  - a. Configure the following settings:
    - ☐ **Syslog Forwarding:** Select **Enabled**.
    - ☐ **Protocol:** Select the communication protocol (**UDP** or **TCP**).

- ☐ **Authentication:** If you selected **TCP** as the **Protocol**, select an authentication method (**Disabled**, **TLS only**, **TLS + certificate**).

## NOTE

If you selected **TLS + certificate** as the authentication method, the **Download and manage certificates from the MXview One Control Panel** message will show. Click the link to go to MXview One Control Panel for managing the syslog forwarding certificate.

- ☐ **Remote IP/Domain Name 1/2:** Specify the IP address or domain name of the 1st and 2nd syslog server.
- ☐ **Port 1/2:** Specify the port number of the 1st and 2nd syslog server.
- b. In the **Syslog Filters** section, configure the syslog filtering rules. The default rule is **Source IP=Any IP, Severity=All**, meaning MXview One will forward all syslog events from all sources and all severities.

To add a filtering rule, click the **Add (+)** icon and configure the following settings:

- ☐ **Source IP:** Specify the IP addresses of the device(s) you want to forward syslog events for. You can enter multiple IP addresses, separated by a comma.

- ☐ **Severity:** Select the event severity level(s) that will be forwarded.

## NOTE

MXview One supports a maximum of 128 syslog forwarding filtering rules.

- c. To delete a filtering rule, click the **Delete (trash icon)** icon next to the rule you want to delete.
- d. Click **Save**.  
MXview One will forward any syslog events that match the configured rules.
- 4. To disable syslog forwarding:
  - a. In the **Syslog Forwarding** field, select **Disabled**.
  - b. Click **Save**.

# 16. Inventory Management

The **Inventory Management** section allows users to manage device inventory, check warranty information, and manage rogue devices.

## Assets and Warranty

### Asset List Overview

To access the **Asset List** page, in the function tree, navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty** and go to the **Asset List** tab.

The **Asset List** section provides a summary of key information about your network devices.

The screenshot shows the 'Assets and Warranty' page with the 'Asset List' tab selected. The table contains the following data:

| Alias                         | Model          | IP              | MAC Address       | Firmware Version          | Serial Number | Warranty End Date | Channel Extended Warranty End Date |
|-------------------------------|----------------|-----------------|-------------------|---------------------------|---------------|-------------------|------------------------------------|
| 192.168.123.70-AWK-3252A      | AWK-3252A      | 192.168.123.70  | 00:90:E8:00:04:12 | v2.0 Build 2023_0217_1145 |               |                   | N/A                                |

This page displays the following information in a table format:

| Column                             | Description                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------|
| Alias                              | The unique name of the device.                                                               |
| Model                              | The model number of the device.                                                              |
| IP                                 | The IP address of the device.                                                                |
| MAC Address                        | The MAC address of the device.                                                               |
| Firmware Version                   | The firmware version of the device.                                                          |
| Serial Number                      | The serial number of the device.                                                             |
| Warranty End Date                  | The date the device warranty expires.                                                        |
| Channel Extended Warranty End Date | The expiration date of the extended device warranty provided by your channel representative. |

### NOTE

The **Channel Extended Warranty End Date** value is provided by the channel partner and must be entered by the user. Refer to [Editing the Channel Extended Warranty End Date](#).

## Searching the Asset List

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Asset List** tab.
3. In the **Search** (🔍) field, type the full or partial information.  
All items matching the entered string will be shown in the table.

## Exporting the Asset List

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Asset List** tab.
3. Click the **Export** (📄) icon in the top-left corner of the table.  
MXview One exports the asset list as a CSV file.

## Editing the Asset List Layout

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Asset List** tab.
3. Click the **Edit Columns** (☰✓) icon in the top-left corner of the table.  
The **Edit Columns** window will appear.

4. To show or hide a column:
  - a. Click the **Visible** (👁) and **Hidden** (👁) icons to toggle column visibility.
5. To change the column order:
  - a. Click and drag the **Drag** (⋮) icon of the column you want to move.

|       |         |
|-------|---------|
| Alias | Visible |
|-------|---------|

  - b. Drag the column to the desired position and release the mouse.
6. To revert all changes to column visibility and order, click **Reset**.

- Click **Save**.

## Warranty Management Overview

To access the **Warranty Management** page, in the function tree, navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty** and go to the **Warranty Management** tab.

The **Warranty Management** section shows warranty information for your devices.

| Alias                         | IP             | MAC Address       | Serial Number | Warranty Duration | Warranty Start Date | Warranty End Date | Channel Extended Warranty End Date | Warranty Status |

### NOTE

The **Channel Extended Warranty End Date** value is provided by the channel partner and must be entered by the user. Refer to [Editing the Channel Extended Warranty End Date](#).

### NOTE

Before using the Warranty Management function, make sure that the URL: <https://api.common.thingsprocloud.com> and port 443 are allowed through the firewall.

## Checking the Warranty Status of All Devices

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Warranty Management** tab.
3. The **Check Warranty Status** section includes the following information:

- **Moxa Warranty Server Status:** This indicates the status of the connection to the Moxa warranty server. If this connection is unavailable, the warranty table cannot be updated until the connection to the warranty server is restored.
  - **Last Update:** Shows the date and time the warranty table was last checked and updated.
4. Click **Retrieve Data**.  
MXview One will check for updates and refresh the table.

## Checking the Warranty Status of a Specific Device

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Warranty Management** tab.
3. The **Manually Check Warranty** section includes the following information:

- **Search by:** Select the criteria to search for warranty information, either based on serial number or MAC address.
  - **Serial Number:** If **Serial Number** is selected in the **Search by** field, specify the serial number of the device to check warranty information for.
  - **MAC Address:** If **MAC Address** is selected in the **Search by** field, specify the MAC address of the device to check warranty information for.
4. Click **Check**.  
MXview One will check and show the warranty information for the specified criteria.

## Searching the Warranty Management List

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Warranty Management** tab.
3. In the **Search** (🔍) field, type the full or partial information.  
All items matching the entered string will be shown in the table.

## Exporting the Warranty Management List

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Warranty Management** tab.

3. Click the **Export** (📄) icon in the top-left corner of the table.  
MXview One exports the warranty management table as a CSV file.

## Editing the Warranty Management List Layout

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Warranty Management** tab.
3. Click the **Edit Columns** (≡✓) icon in the top-left corner of the table.

The **Edit Columns** window will appear.

4. To show or hide columns:
  - a. Click the **Visible** (👁) and **Hidden** (👁) icons to toggle column visibility.
5. To change the column order:
  - a. Click and drag the **Drag** (⋮) icon of the column you want to move.

- b. Drag the column to the desired position and release the mouse.
6. To revert all changes to column visibility and order, click **Reset**.
  7. Click **Save**.

## Editing the Channel Extended Warranty End Date

1. Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
2. Go to the **Warranty Management** tab.
3. Check the box of the device(s) you want to edit the Channel Extended Warranty End Date for.
4. Click the **Edit** (✎) icon in the **Channel Extended Warranty End Date** column of the device you want to edit.  
If you selected multiple devices, click the **Edit** (✎) icon in the top-left corner of the page.

## Warranty Notifications Overview

To access the **Warranty Notifications** page, in the function tree, navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty** and go to the **Warranty Notifications** tab.

From the **Warranty Notifications** tab, you can enable and configure warning notifications to inform you when a device's warranty is about to expire.

### Enabling Warranty Expiration Notifications

- Navigate to **Menu** (☰) > **Inventory Management** > **Assets and Warranty**.
- Go to the **Warranty Notifications** tab.
- Configure the following settings:
  - Enabled:** Enable or disable warranty expiration notifications.
  - Send Reminder:** Specify how many days before the Warranty End Date/Channel Extended Warranty End Date you want to receive a notification.
  - Email to:** Enter the email address of the warranty notification recipient(s).

#### NOTE

You can add multiple recipient email addresses, separated by a comma.

- Click **Save**.  
MXview One will send an email notification to the specified recipients when the number of days from the current date to the device Warranty End Date/Channel Extended Warranty End Date is equal to the value set in the **Send Reminder** field.

# Rogue Device Detection

From the **Rogue Device Detection** section, users can create a baseline of the currently monitored devices. When MXview One detects an unknown device connection that is not part of this baseline, the system will identify and show information about this rogue device. This feature can help users manage the connection status of devices within their network, preventing unknown devices from gaining access to the network.

## Rogue Device Settings Overview

To access the **Rogue Device Settings** page, in the function tree, navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection** and go to the **Rogue Device Settings** tab.

From the **Rogue Device Settings** tab, you can create a device baseline and enable the rogue device detection function.

## Creating a Device Baseline

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Rogue Device Settings** tab.
3. The **Device Baseline** section includes the following information:

- **Created on:** Shows the date and time when the most recent baseline was created. If no baseline has been created before, this will show **N/A**.

- Click **Create**.  
The **Device Baseline** window will appear.

- Click **Create**.  
MXview One will create a baseline of the currently monitored devices and enable the **Rogue Device Detection** function.

## Enabling/Disabling Rogue Device Detection

### NOTE

To enable or disable **Rogue Device Detection**, a device baseline must be created first. Refer to [Creating a Device Baseline](#).

- Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
- Go to the **Rogue Device Settings** tab.
- In the **Rogue Device Detection** section, configure the following settings:

- **Enabled:** Enable or disable the Rogue Device Detection function.
- Click **Save**.

### NOTE

After creating a device baseline and enabling the **Rogue Device Detection** function, you can add devices to the baseline via the **Device Discovery** function or by [Adding a Rogue Device to the Baseline](#).

## Device Baseline Overview

To access the **Device Baseline** page, in the function tree, navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection** and go to the **Device Baseline** tab.

From the **Device Baseline** tab, you can view information about the devices included in the most recent baseline. From this screen, you can also add or remove devices from the baseline and export the device baseline.

This page displays the following information in a table format:

| Column      | Description                                        |
|-------------|----------------------------------------------------|
| MAC Address | The MAC address of the device.                     |
| IP Address  | The IP address of the device.                      |
| NIC Vendor  | The vendor of the device's network interface card. |

### Searching the Device Baseline

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Device Baseline** tab.
3. In the **Search** (🔍) field, type the full or partial information.  
All items matching the entered string will be shown in the table.

### Adding a Device to the Baseline

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Device Baseline** tab.
3. Click the **Add** (+) icon in the top-left corner of the screen.  
The **Add Device to Baseline** screen will appear.
4. Specify the MAC address of the device you want to add to the baseline.
5. Click **Add**.

### Deleting Devices From the Baseline

#### NOTE

If a device that was removed from the baseline attempts to reconnect, MXview One will identify the device as a rogue device and add it to the **Current Rogue Devices** list. Refer to [Current Rogue Devices Overview](#).

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Device Baseline** tab.  
To delete a single device:

- a. Click the **Delete** (🗑️) icon next to the device you want to delete from the baseline.  
The **Delete Device From Baseline** screen will appear.

3. To delete multiple devices:
  - a. Check the box of the devices you want to delete from the baseline.
  - b. Click the **Delete** (🗑️) icon in the top-left corner of the screen.  
The **Delete Device From Baseline** screen will appear.

4. Click **Delete**.

## Exporting the Device Baseline

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Device Baseline** tab.
3. Click the **Export** (📄) icon in the top-left corner of the table.  
MXview One exports the device baseline as a CSV file.

## Current Rogue Devices Overview

To access the **Current Rogue Devices** page, in the function tree, navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection** and go to the **Current Rogue Devices** tab.

From the **Current Rogue Devices** tab, you can view information about rogue devices detected on your network.

| <input type="checkbox"/> | 00:0C:29:29:C6:3C | 192.168.123.209 | 2024-07-23 AM 03:51:36 | 2024-07-23 AM 10:12:43 | 192.168.123.152/Port1 | Vmware Inc                  |

This page displays the following information in a table format:

| Column      | Description                                                   |
|-------------|---------------------------------------------------------------|
| MAC Address | The MAC address of the rogue device.                          |
| IP Address  | The IP address of the rogue device.                           |
| First Seen  | The date and time MXview One first detected the rogue device. |

|                       |                                                              |
|-----------------------|--------------------------------------------------------------|
| Last Seen             | The date and time MXview One last detected the rogue device. |
| Connected Switch/Port | The switch device and port the rogue device is connected to. |
| NIC Vendor            | The vendor of the rogue device's network interface card.     |

## NOTE

It is possible to see the same IP listed with different MAC addresses in the rogue device list. This could indicate one of the following situations:

- A single device with multiple MAC addresses: In addition to a CPU MAC address, certain Moxa products (e.g. EDS-(G)4000 Series, MDS-G4028 Series, etc.) and some third-party devices have an individual MAC address for each port.
- Different devices using the same IP address: Different devices using an identical IP address indicate a possible IP conflict. To avoid issues, identify and resolve any IP conflicts.

## Searching the Current Rogue Devices List

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Current Rogue Devices** tab.
3. In the **Search** (🔍) field, type the full or partial information.  
All items matching the entered string will be shown in the table.

## Adding a Rogue Device to the Baseline

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Current Rogue Devices** tab.
3. Click the **Add** (+) icon next to the rogue device you want to add to the baseline.  
To add multiple rogue devices to the baseline, check the box of the devices you want to add and click the **Add** (+) icon in the top-left corner of the screen.

The **Add Device to Baseline** window will appear.

### Add Device to Baseline

Are you sure you want to add this device to the baseline?

Cancel
Add

4. Click **Add**.

## Exporting the Current Rogue Devices List

1. Navigate to **Menu** (☰) > **Inventory Management** > **Rogue Device Detection**.
2. Go to the **Current Rogue Devices** tab.
3. Click the **Export** (📄) icon in the top-left corner of the table.  
MXview One exports the current rogue devices list as a CSV file.

## Rogue Device History Overview

To access the **Rogue Device History** page, in the function tree, navigate to **Menu (☰) > Inventory Management > Rogue Device Detection** and go to the **Rogue Device History** tab.

From the **Rogue Device History** tab, you can view information about rogue devices that were originally in the Current Rogue Devices list but are currently no longer detected by MXview One.

### Searching the Rogue Device History

1. Navigate to **Menu (☰) > Inventory Management > Rogue Device Detection**.
2. Go to the **Rogue Device History** tab.
3. In the **Search (🔍)** field, type the full or partial information.  
All items matching the entered string will be shown in the table.

### Exporting the Rogue Device History

1. Navigate to **Menu (☰) > Inventory Management > Rogue Device Detection**.
2. Go to the **Rogue Device History** tab.
3. Click the **Export (📄)** icon in the top-left corner of the table.  
MXview One exports the rogue device history as a CSV file.

### Clearing the Rogue Device History

1. Navigate to **Menu (☰) > Inventory Management > Rogue Device Detection**.
2. Go to the **Rogue Device History** tab.
3. Click the **Delete (🗑️)** icon in the top-left corner of the screen.  
The **Clear Rogue Device History** window will appear.

4. Click **Delete**.  
MXview One will clear the rogue device history.

# 17. Backups, Restores, and Compares

The MXview One web console provides several features to assist database backups and device configuration migrations. MXview One allows you to back up or restore configurations for multiple devices, and also compare changes between different versions of archived configuration files. You can also create scheduled jobs to automatically export/import device configurations or back up the MXview One database.

## Backing Up the MXview One Database

Use the **DB Backup & Restore** screen on the **Control Panel** to back up the MXview One database.

1. Navigate to **DB Backup & Restore** on the MXview One Control Panel.

The Database Backup & Restore screen appears.

The screenshot shows the MXview One Control Panel interface. On the left is a sidebar with navigation links: Server Control, Configuration, DB Backup & Restore (highlighted), Plug-in Manager, and Certificate. The main area has two tabs: Backup and Restore. The Backup tab is active, showing a 'Name \*' text input field and a 'Save' button. The character count '0 / 255' is displayed below the input field.

2. Choose the **Backup** tab to start the process of backing up the database.
3. In the **Name** field, specify the backup file name.
4. Click **Save**.
5. The message that the file of the backup database has been stored in the specified directory will be displayed.

The screenshot shows a dark gray message box with white text: "The database has been backed up to C:\Users\...\AppData\Roaming\moxa\mxview one\db\_backup\20230709\_120518".

6. The **Database backup completed** will appear on the **Historical backups** list.

The screenshot shows the MXview One Control Panel interface. The 'Backup' tab is active. The 'Name' field now contains 'Backup test' and the character count is '11 / 255'. Below the input field is a green 'Save' button. Underneath is a section titled 'Historical backups' containing a table with the following data:

| Version | Name         | Date     | Time     |
|---------|--------------|----------|----------|
| 1.1     | Backup test  | 20221215 | 13:23:37 |
| 1.1     | Backup test2 | 20221215 | 13:42:02 |
| 1.1     | XXX-20221223 | 20221223 | 14:09:09 |

# Backing Up Device Configurations

Use the **Device Configuration Center** screen to export configuration backup files from one or more devices.

1. Navigate to **Menu** (☰) > **Device Configuration Center**.

The **Device Configuration Center** screen appears.

2. Click the **Backup** tab.

Available devices will appear in the **Device List**.

3. (Optional) Filter the devices in the **Device List**:

- a. Click the **Filter** (≡) icon.
- b. Specify any of the following criteria:
  - ☐ **Group:** The group in the MXview One tree structure that the device is assigned to
  - ☐ **IP Address:** The IP address of the device
- c. Click **Apply**.

MXview One filters the **Device List** according to the specified criteria.

4. To export the device list from all available devices:

- a. Click the **Export** (📄) icon.

MXview One exports the 'All available devices' list as a CSV file.

5. To back up configurations from specific devices:
  - a. Select the check box next to the device(s) you want to back up.
  - b. Click the **Backup** (📁) icon in either of the following locations:
    - ☐ For a single device, click the **Backup** (📁) next to the selected device.
    - ☐ For multiple devices, click the **Backup** (📁) icon in the upper left corner of the screen.

The **Backup Configuration** screen appears.

- c. Click **Save**.  
MXview One archives configuration files from selected device(s) to the MXview One server and displays them in the **Records** tab. Also, MXview One will export configurations from the selected device(s) as a ZIP file.

For more information, please see the following topics:

#### **Comparing Archived Configuration Files**

### **NOTE**

If MXview One compares two configuration files and they are the same, it will only leave the latest one. If the two configuration files are different, MXview One will keep both in the **Records** tab.

# Restoring Device Configurations

Use the **Configuration Center** screen to restore configurations to one or more devices by restoring an archived configuration from the MXview One server or importing a local configuration backup file (in INI format).

1. Navigate to **Menu** (☰) > **Device Configuration Center**.

The **Device Configuration Center** screen will appear.

2. Click the **Restore** tab.

Available devices will appear in the **Device List**.

3. (Optional) Filter the devices in the **Device List**:

- a. Click the **Filter** (≡) icon.
- b. Specify any of the following criteria:
  - ☐ **Group:** The group that the device is assigned to
  - ☐ **IP Address:** The IP address of the device
- c. Click **Apply**.

MXview One filters the **Device List** according to the specified criteria.

4. (Optional) Export configurations from all available devices:

- a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.

MXview One exports the 'All available devices' list as a CSV file.

5. To restore an archived configuration file to a device:

- a. Click the **Restore** (🕒) icon next to the **IP Address** of a device in the **Device List**.

The **Restore Configuration** screen will appear.

- b. From the **Restore Configuration** drop-down list, select the archived device configuration to restore.

- c. Click **Apply**.

MXview One imports the configuration file to the selected device.

6. To import a local configuration file to a device:
- a. Click the **Restore** (🕒) icon next to the **IP Address** of a device in the **Device List**.

The **Restore Configuration** screen appears.

- b. From the **Restore Configuration** drop-down list, select **Local File**.

- c. Click the **Configuration File** field to select the configuration file.

The 'Restore Configuration' dialog box shows the 'Restore Device - 10.81.10.11' and 'Restore Configuration' options. The 'Local File' dropdown is selected. The 'Configuration File' field is empty, with a folder icon to its right. At the bottom are 'Cancel' and 'Apply' buttons.

- d. Select the configuration file to import and click Open.

- e. Click **Apply**.

The 'Restore Configuration' dialog box is shown with the 'Configuration File' field now containing the text '10.81.10.11.ini'. The 'Local File' dropdown remains selected. The 'Apply' button is highlighted in green.

MXview One imports the configuration file to the selected device.

## Comparing Archived Configuration Files

Use the **Device Configuration Center** to compare changes in the history of saved configuration files.

1. Navigate to **Menu** (☰) > **Device Configuration Center**.

The **Device Configuration Center** screen appears.

2. Click the **Records** tab.

A list of archived backup configuration files appears.

The 'Configuration Center' screen shows the 'Records' tab selected. It displays a table of archived configuration files with columns for 'Configuration File', 'Creating Time', and 'Last Checking Time'. The table lists 9 files, each with a file icon, a trash icon, and a refresh icon. A search bar is located at the top right of the table area. At the bottom right, there is a pagination control showing 'Items per page: 50' and '1 - 9 of 9'.

| Configuration File            | Creating Time       | Last Checking Time  |
|-------------------------------|---------------------|---------------------|

3. (Optional) Filter the list of configuration files:
  - a. Click the **Filter** (☰) icon.
  - b. Specify any of the following criteria:
    - ☐ **Group:** The group that the device is assigned to
    - ☐ **Start Date:** The earliest file creation date
    - ☐ **Start Time:** The earliest file creation time on the Start Date
    - ☐ **End Date:** The latest file creation or update date
    - ☐ **End Time:** The latest file creation or update time on the End Date
  - c. Click **Apply**.
4. (Optional) Export configurations from all available devices:
  - a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.  
MXview One exports all the devices information as a CSV file.
5. Click the **Compare** (🔍) icon next to the configuration file you want to compare.  
The **Compare Configurations** screen will appear.

The inserted, deleted, and modified lines in the configuration will be highlighted.

## NOTE

The green lines are the configurations of Compare Target. The red lines are the configurations of Compare basement.

# Creating Maintenance Scheduler for Database/Configuration Backups

Use the **Maintenance Scheduler** to automatically export/import device configurations or back up the MXview One database on a predefined schedule.

- Navigate to **Menu** (☰) > **Administration** > **Maintenance Scheduler**.  
The **Maintenance Scheduler** screen appears.
- (Optional) Search a previously saved scheduled job, type a job name in the search box.  
The **Maintenance Scheduler** table displays a list of matching scheduled jobs.
- Click the **Add** (+) button.  
The **Add job** screen appears.
- Specify the Job Name.
- Select one of the following options from the Action drop-down box:
  - **Export Configuration**
  - **Import Configuration**
  - **Database Backup**
- Type a **Description** for the job.
- Select the **Registered Devices** that apply.
- Select a job frequency from the **Repeat Execution** drop-down box:
  - Once
  - Daily
  - Weekly
  - Monthly

9. Specify the **Start Date** to begin executing the scheduled job.
10. Specify the **Execution Time** on the Start Date to run the scheduled job.
11. Click **Add**.

MXview One will display the scheduled job on the **Maintenance Scheduler** table and will execute the job according to the defined schedule.

# 18. Custom Integrations

MXview One supports several features that enable integration with third-party applications or external systems.

## OPC UA Server Overview

MXview One supports integrated OPC UA Server functionality to integrate with OPC clients such as SCADA systems. From this section, users can configure OPC tags and server settings.

To access the **OPC UA Server** screen, navigate to **Menu** (☰) > **Integration** > **OPC UA Server**.

## Viewing the OPC Tags Table

1. Navigate to **Menu** (☰) > **Integration** > **OPC UA Server**. The **OPC UA Server** screen appears.
2. Go to the **OPC Tags** tab.
3. The OPC tags table includes the following information:

| Column             | Description                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status             | Shows the status of the OPC tag.                                                                                                                                                                                                                                                             |
| Device Property    | Shows the SNMP device property of the tag name.                                                                                                                                                                                                                                              |
| Tag Name           | Shows the tag name.                                                                                                                                                                                                                                                                          |
| Registered Devices | Shows the devices registered to the tag. Click the hyperlink number in this column to show an overview of all registered devices. <div><div>Registered Devices</div><div><div>Device Alias</div><div>192.168.123.152-EDS-518A192.168.123.157-IEK-402-SHDSL</div></div><div>Close</div></div> |

## Adding an OPC Tag

1. Navigate to **Menu** (☰) > **Integration** > **OPC UA Server**.  
The **OPC UA Server** screen appears.
2. Go to the **OPC Tags** tab.
3. Click the **Add** (+) icon.  
The **Add OPC Tag** screen will appear.

4. Configure the following settings:
  - **Status:** Select to enable or disable the OPC tag.
  - **Device Property:** Select the SNMP property to generate the OPC tag.
  - **Tag Name:** Enter a name for the OPC tag.
  - **Registered Devices:** Select the devices to register to this tag.
5. Click **Add**.  
If the total number of registered devices exceeds 4000, an error message will show.

A confirmation will appear to verify tag was created.

## NOTE

MXview One supports a maximum of 2000 OPC tags.

## Editing an OPC Tag

1. Navigate to **Menu** (☰) > **Integration** > **OPC UA Server**.  
The **OPC UA Server** screen appears.
2. Go to the **OPC Tags** tab.
3. Click on the **Edit** (✎) icon next to the tag you want to edit.  
The **Edit OPC Tag** screen will appear.

The 'Edit OPC Tag' dialog box contains the following fields and controls:

- Status \***: A dropdown menu with 'Enabled' selected.
- Device Property**: A text field with 'Availability' entered.
- Tag Name \***: A text field with 'Availability' entered.
- Registered Devices \***: A dropdown menu showing '12 / 64' and a list of IP addresses including '192.168.127.25-PT-G7728, 192.16...'. A '12 / 64' indicator is also present next to the field.
- At the bottom right, there are two buttons: 'Close' (in green) and 'Apply' (in grey).

4. Configure the following settings:
  - **Status**: Select to enable or disable the OPC tag.
  - **Tag Name**: Enter a name for the OPC tag.
  - **Registered Devices**: Select the devices to associate this tag with.
5. Click **Apply**.  
A confirmation will appear to verify the tag was updated.

## Deleting an OPC Tag

1. Navigate to **Menu** (☰) > **Integration** > **OPC UA Server**.  
The **OPC UA Server** screen appears.
2. Go to the **OPC Tags** tab.
3. Click the **Delete** (🗑️) icon next to the tag you want to delete.  
A confirmation window will appear.

The 'Delete OPC tag' dialog box contains the following elements:

- Delete OPC tag**: The title of the dialog in green.
- Are you sure you want to delete this OPC tag?**: The confirmation question.
- At the bottom, there are two buttons: 'Cancel' (in green) and 'Delete' (in dark green).

- Click **Delete**.  
A confirmation will appear to verify the tag was deleted.

## Deleting Multiple OPC Tags

- Navigate to **Menu** (☰) > **Integration** > **OPC UA Server**.  
The **OPC UA Server** screen appears.
- Go to the **OPC Tags** tab
- Select the checkbox of the OPC tags you want to delete in the list.
- Click the **Delete** (🗑️) icon at the top of the page.

- A confirmation window will appear.

- Click **Delete**.  
A confirmation will appear to verify the tags were deleted.

## Configuring OPC UA Server Settings

- Navigate to **Menu** (☰) > **Integration** > **OPC UA Server**.  
The **OPC UA Server** screen appears.
- Go to the **Server Settings** tab.
- Enable the OPC UA server.

4. Configure the following settings:

The screenshot shows the 'MXview ONE' interface for configuring the 'OPC UA Server'. The 'Server Settings' tab is active. The configuration includes:

- Endpoint URL:** `opc.tcp://127.0.0.1:4840/MXviewOne/OPCUA`
- Enable OPC UA Server:** A dropdown menu set to 'Enabled'.
- IP/Domain Name:** `127.0.0.1` (with a character count of 9 / 253).
- Port:** `4840` (with a range of 1 - 65535).
- Authentication Settings:** A dropdown menu set to 'Anonymous'.
- Security Mode:** A dropdown menu set to 'Disabled'.
- Supported Security Policies:** A list of security policies: Basic128Rsa15, Basic256, Basic256Sha256, Aes128Sha256RsaOaep, and Aes256Sha256RsaPss.
- Save:** A green button at the bottom.

- **IP/Domain Name:** Specify the OPC UA server's IP or domain name.
  - **Port:** Enter the server port.
  - **Authentication Settings:** Select an authentication method.
    - ☐ **Anonymous:** OPC clients can connect to the OPC UA server anonymously without authentication.
    - ☐ **Account and Password:** Specify an account and password for OPC clients to connect to the OPC UA server (MXview One).
    - ☐ **Certificate:** Authenticate OPC clients using a certificate provided by MXview One Control Panel.
  - **Allow No Security:** Enable or disable allowing no security.
    - ☐ **Disabled:** The connection requires encryption.
    - ☐ **Enabled:** The connection can be established without encryption.
5. Click **Save**.

## Managing RESTful API Keys

MXview One supports RESTful APIs for custom integrations with third-party products. Use the **API Key Management** screen to add new applications and generate API keys.

1. Navigate to **Menu** (☰) > **Integration** > **API Key Management**.  
The **API Key Management** screen will appear.

## NOTE

Deleting the application will prevent any APIs that use the old API key from working properly.

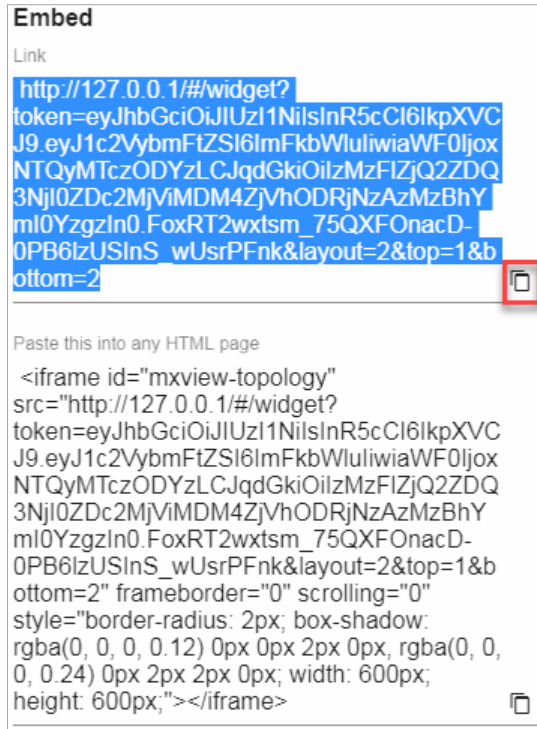

- To view API reference documentation, navigate to **Menu** (☰) > **Help** > **API Documentation**. The **MXview One API** screen will appear and display the reference document for supported MXview One APIs. Click **API user guide** below the MXview One API title, where you can find the guidelines for using the RESTful API functions.

## Embedding Web Widgets

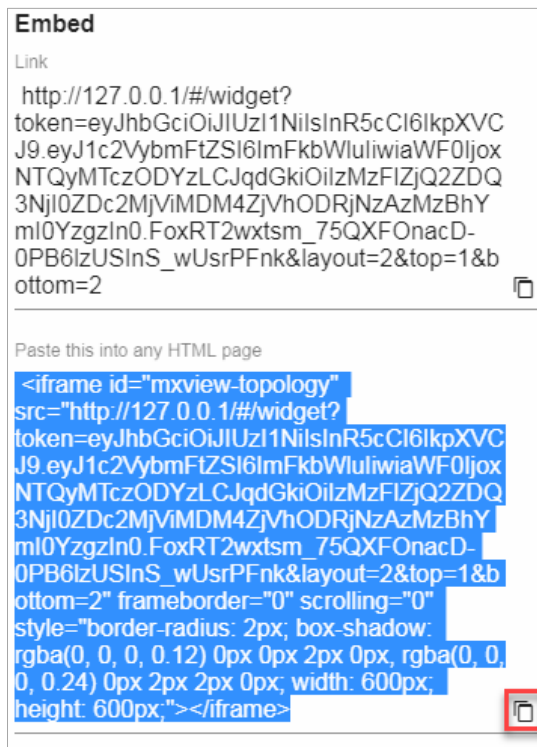

MXview One allows you to embed the Topology Map and Recent Events widgets from the MXview One **Topology** screen in third-party applications.

- Navigate to **Menu** (☰) > **Integration** > **Embedded Web Widget**. The **Embedded Web Widget** screen will appear.
- From the **Select API Key** drop-down list, select the **Application Name** for the API key you want to use.

3. From the **Select Layout** drop-down list, select the widget(s) you want to embed:
  - **Topology and Recent Events:** Embeds both the Topology Map and Recent Events widgets in the target application
  - **Topology:** Embeds only the Topology Map in the target application
  - **Recent event:** Embeds only the Recent Events widget in the target application
4. Copy and paste the widget link for the target application:
  - To embed the widget in a web application, click the **Copy link** (📋) icon in the **Link** section.

- To embed the link in a static HTML page, click the **Copy link** (📋) icon in the **Paste this into any HTML page** section.

# 19. Wireless Add-on Module

MXview One supports several optional modules that extend the functionality of the main module. These modules require a separate license to use.

## Introduction

The MXview One Wireless Add-on Module provides a set of tools to help you monitor and troubleshoot your wireless network through MXview One and supports up to a total of 200 wireless APs and clients. The add-on gives you clear, real-time information about the status of your wireless network including the client roaming status and key wireless performance indicators such as SNR and noise level. The wireless module also instantly notifies you of any problems with your wireless devices and helps you narrow down the root cause of the problem, allowing for quick and easy troubleshooting.

## System Requirements

The computer that the MXview One Wireless Add-on Module is installed on must satisfy the following system requirements based on the maximum capacity of 200 wireless APs and clients:

|                      | System Requirements                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------|
| CPU                  | 2 GHz or faster dual core CPU                                                                              |
| RAM                  | 8 GB or higher                                                                                             |
| Hard Disk Space      | 20 to 30 GB for 1 month of performance and event history recording                                         |
| OS                   | Windows 10 (64-bit)<br>Windows 11 (64-bit)<br>Windows Server 2016 (64-bit)<br>Windows Server 2019 (64-bit) |
| Browser Requirements | Chrome: Version 76 or later<br>Firefox: Version 69 or later<br>Microsoft Edge: Version 79 or later         |

## Supported Devices

The MXview One Wireless Add-on Module supports the following wireless devices:

- AWK-1131A Series (firmware v1.22 or higher)
- AWK-1137C Series (firmware v1.6 or higher)
- AWK-1151C Series (firmware v2.0 or higher)
- AWK-1161A Series (firmware v1.0 or higher)
- AWK-1161C Series (firmware v1.0 or higher)
- AWK-1165A Series (firmware v1.0 or higher)
- AWK-1165C Series (firmware v1.0 or higher)
- AWK-3131A Series (firmware v1.16 or higher)
- AWK-3252A Series (firmware v2.0 or higher)
- AWK 3262A Series (firmware v1.1 or higher)
- AWK-4131A Series (firmware v1.16 or higher)
- AWK-4252A Series (firmware v2.0 or higher)
- AWK 4262A Series (firmware v1.1 or higher)

# Getting Started With the Wireless Add-on Module

In order to use the MXview One Wireless Add-on module, you will need to activate it first. You can choose to activate a new license, or enable the Wireless Add-on 90-Day free trial through the license management page.

The system will automatically restart after you activate the module. A message will appear telling you to wait 10 seconds while the module activates. Once done, click **OK** to refresh your browser and enable the Wireless Add-on features.

- For detailed information on how to activate the MXview One Wireless Add-on Module, refer to **License Management**.
- To add wireless devices to your MXview One network, refer to **Using Device Discovery**.

## NOTE

Please activate the Node-based License first and then the Wireless Add-on License.

# Wireless Module Features

The MXview One Wireless Add-on Module offers a set of features specifically designed to help you monitor and troubleshoot your wireless network more easily.

## Main Dashboard

If the wireless module is activated, the MXview One Dashboard will include a **Wireless** tab and show AP Traffic Load and the Wireless Device Summary information.

To access the **Dashboard**, navigate to **Menu** (☰) > **Dashboard** and go to the **Wireless** tab.

The AP Traffic Load graph shows the aggregated traffic of all the AP devices monitored by MXview One. You can select a specific time to check the wireless network status at that time. MXview One provides three time sections: **Last 24 hours**, **Last week**, and **Last 2 weeks**.

The Wireless Device Summary shows the number of deployed wireless devices. Clicking one of the cards will direct you to the Wireless Device Summary screen where you can find more detailed information about the wireless devices.

To refresh the data displayed in all the widgets, click the **Settings** (⚙️) icon in the top-right corner of the screen and select **Refresh All**.

## Dynamic Wireless Client Roaming

The MXview One Wireless Add-on Module features dynamic wireless roaming display, which updates roaming connections of wireless clients in real-time. Instead of using LLDP data to draw links between devices, MXview One uses both the client list data from the wireless AP and AP data from the wireless client to detect wireless roaming changes.

To enable the dynamic wireless client roaming function, toggle the **Dynamic client position** option. In this mode, wireless clients will automatically move below the AP they connect to when roaming. The link between the client and AP on the topology will also change dynamically if the client connects to another AP.

Refer to the table below for a description of each display option.

| Option                  | Description                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show clients            | Toggle this option on or off to show or hide wireless clients on the topology                                                                                                       |
| Dynamic client position | Enable this option to have wireless clients move to a position close to the AP they are associated with<br>Disabling this option will return the clients to their original position |

The following diagrams are an example of the dynamic roaming display showing dynamic client-AP link changes.

In the first scenario there are two wireless APs that each have one client connected to it.

When the client roams to another AP, MXview One will automatically redraw the link to the new AP on the wireless topology diagram.

## AP/Client Device Dashboard

Use the **AP/Client Device Dashboard** screens to see detailed information and performance statistics of the client or AP.

To access the AP/Client Device Dashboard, click on any wireless AP or client device's icon on the topology diagram and click **Device Dashboard** in the toolbar.

## AP Device Dashboard

The AP Device Dashboard shows the following information:

| Parameter          | Description                                                                                           |                                                                                          |
|--------------------|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Client Count       | Managed                                                                                               | The total number of wireless clients connected to this AP that are managed by MXview One |
|                    | Connected                                                                                             | The total number of wireless clients that are connected to this AP                       |
| Security Mode      | The Security Mode of the AP: Open, WEP, WPA, or WPA2                                                  |                                                                                          |
| TX Power           | The current transmission power of the AP                                                              |                                                                                          |
| Uptime             | The total time the wireless AP has been online since the last restart                                 |                                                                                          |
| Traffic Load       | The current and historical traffic throughput of the wireless interface                               |                                                                                          |
| CPU Utilization    | The current and historical CPU utilization of the AP (only supported by certain firmware versions)    |                                                                                          |
| Memory Utilization | The current and historical memory utilization of the AP (only supported by certain firmware versions) |                                                                                          |

# Client Device Dashboard

Client Dashboard-192.168.127.166--AWK-1137C

The Client Device Dashboard shows the following information:

| Parameter          | Description                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BSSID              | The BSSID of the wireless AP the client is connected to                                                                                                                             |
| Security Mode      | The Security Mode of the client: Open, WEP, WPA, or WPA2                                                                                                                            |
| Link Speed         | The real-time bandwidth of the connection to the AP                                                                                                                                 |
| Connected          | The total time the wireless client has been connected to the AP                                                                                                                     |
| SNR                | The current and historical Signal-to-Noise ratio of the client<br>If the wireless device has multiple antennas, the SNR of each antenna will be separately shown as SNR-A and SNR-B |
| Signal Strength    | The current and historical signal strength of the client                                                                                                                            |
| Noise Floor        | The current and historical noise floor of the client                                                                                                                                |
| Traffic Load       | The current and historical traffic throughput of the wireless interface                                                                                                             |
| CPU Utilization    | The current and historical CPU utilization of the client (only supported by certain firmware versions)                                                                              |
| Memory Utilization | The current and historical memory utilization of the client (only supported by certain firmware versions)                                                                           |

You can view the device diagnostics and usage parameters in real-time or recall the history for up to the last 3 days from the drop-down menu in the top-right. You can zoom in on the timeline to examine a narrower time period. Double-click the timeline to return to the original view.

## Wireless Device Summary

The Wireless Device Summary screen provides detailed information about all the AP and client devices including the device’s IP and MAC address, operation mode, and current signal strength.

To access the Wireless Device Summary screen, expand the **Wireless** (📶) menu in the toolbar and click **Wireless Device Summary**.

Click **Back** in the top-left corner to return to the topology view.

The screenshot shows the "Wireless Device Summary" screen. On the left, there is a sidebar with filters: "All (5)", "AP (2)", and "Client (3)". The main area displays a table of devices. The table has columns: Operation Mode, IP Address, MAC Address, BSSID, Channel, Noise Floor, and Signal Strength (dBm). The data is grouped by AP. The first group is for AP - 192.168.127.168 (Site Name: Site BRANDONYANG-PC / MAC Address: 00:90:E8:52:39:50 / Channel: 1), showing one client device. The second group is for AP - 192.168.127.169 (Site Name: Site BRANDONYANG-PC / MAC Address: 00:90:E8:7C:C3:01 / Channel: 1), showing one client device. The third group is for Unmanaged AP (Site Name: Site BRANDONYANG-PC), showing one client device. At the bottom right, there is a pagination control showing "Items per page: 50" and "1 - 5 of 5".

| Operation Mode                                                                                      | IP Address      | MAC Address       | BSSID             | Channel | Noise Floor | Signal Strength (dBm) |
|-----------------------------------------------------------------------------------------------------|-----------------|-------------------|-------------------|---------|-------------|-----------------------|
| AP - 192.168.127.168 (Site Name: Site BRANDONYANG-PC / MAC Address: 00:90:E8:52:39:50 / Channel: 1) |                 |                   |                   |         |             |                       |
| Client                                                                                              | 192.168.127.165 | 00:90:E8:52:39:75 | 06:90:E8:52:39:50 | 1       | -88         | -23                   |
| AP - 192.168.127.169 (Site Name: Site BRANDONYANG-PC / MAC Address: 00:90:E8:7C:C3:01 / Channel: 1) |                 |                   |                   |         |             |                       |
| Client                                                                                              | 192.168.127.166 | 00:90:E8:63:A7:6C | 06:90:E8:7C:C3:01 | 1       | -91         | -22                   |
| Unmanaged AP (Site Name: Site BRANDONYANG-PC)                                                       |                 |                   |                   |         |             |                       |
| Client                                                                                              | 192.168.127.167 | 00:90:E8:52:07:85 | N/A               | 1       | N/A         | N/A                   |

# Wireless Roaming Playback

Through the Wireless Roaming Playback screen, you can recall the roaming history of a specific client. By default, MXview One will keep the roaming playback data for 30 days.

To access the Wireless Roaming Playback screen, expand the **Wireless** (📶) menu in the toolbar and click **Wireless Roaming Playback**.

Click **Back** in the top-left corner to return to the topology view.

On the left-hand side is a list of wireless clients, in the center is the topology map, and located at the bottom is the playback progress bar. Select any client from the list and click **Play** (▶) to start playing the wireless roaming history for the selected time range. You can adjust the playback speed by clicking the **Decrease Speed** (◀) or **Increase Speed** (▶) button to increase or decrease the playback speed respectively.

To view the history for a specific time and date, click (  ) to choose the starting date, set the time in the Start Time field, select the duration of the playback history from the Duration drop-down menu, and click **Apply**.

Time Range:  1/22/2021  08:58  1 hr

The progress bar also displays the RSSI value at the time. In addition, the red dots indicate the time when the wireless client roamed to a different AP. You can zoom in on the timeline to examine a narrower time period. Click **Apply** to return to the original view.

## 20. Power Add-on Module

---

MXview One supports several optional modules that extend the functionality of the main module. These modules require a separate license to use.

### Introduction

The MXview Power Add-on Module provides a set of features to help you monitor and troubleshoot your power substation network that follows the IEC 61850 standard and supports switches that have the PRP/HSR function with deep visualization. To monitor the IED (Intelligent Electronic Device), which is an important device that can receive data and issue commands on the network, MXview Power supports the MMS protocol to view and provide the status of the IED. Furthermore, there is a critical packet called GOOSE in power substation networks, and MXview Power can also help customers troubleshoot GOOSE events such as GOOSE Timeout and GOOSE Tampered. The power module instantly notifies you of any problems with your power devices and helps you narrow down the root cause of the problem, allowing for quick and easy troubleshooting.

### System Requirements

The computer that the MXview Power Add-on Module is installed on must satisfy the same system requirements as those required for MXview One. See **System Requirements** in Chapter 1 for more information.

### Supported Devices With PRP/HSR Features

PRP/HSR features can be visualized with the devices that support PRP/HSR functions or have a PRP/HSR module.

- PT-G503 Series (firmware v5.1 or higher)
- PT-G510 Series (firmware v6.4 or higher)
- PT-G7728/G7828 Series with LM-7000H-2GPHR modules (firmware v6.2 or higher)
- DA-820C Series and DN-PRP-HSR-I210 or DA-PRP-HSR-I210 (OS Win 10 or higher)
- MDS-G4000 Series (L2 models only) with LM-7000H-2GPHR modules (firmware v5.0 or higher)

# Getting Started With the Power Add-on Module

In order to use the MXview Power Add-on module, you will need to activate it first. You can choose to activate a new license or enable the Power Add-on 90-day free version through the License Management page.

Start to experience the MXview One Security Add-on

Start Trial

Re-activate License

Use both the Deactivation Code and a User Code to re-activate your license. Re-activate.

Re-activate

The system will automatically restart after you activate the module. A message will appear telling you to wait 10 seconds while the module activates. Once done, click **OK** to refresh your browser and enable the Power Add-on features.

Activating...

The operation will finish in 10 seconds.

OK (9)

- For detailed information on how to activate the MXview Power Add-on Module, refer to **Chapter 4: License Management**.
- To add power devices to your MXview One network, refer to **Using Device Discovery**.

## NOTE

Please activate the Node-based License and then the Power Add-on License.

MXview One 1.7.0 User Manual

265

- b. Scroll down or type the GOOSE-related information, such as IED name or GoCB name.

### Display Options

1. Once you have activated the MXview Power add-on module, you can see the display options include extra functions such as PRP LAN A, PRP LAN B, and HSR Ring.
2. If the box is checked, you can see the color of the link for the PRP/HSR on the topology. If you uncheck the box, then the link will not display the color for the PRP/HSR function.

### NOTE

PRP LAN A is represented by a green line, PRP LAN B by a blue line, and HSR Ring by a purple line.

### NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices, such as an IED device. However, you can draw the link of the topology manually by clicking **Add Link**.

## Ungrouping an IED Group

After executing the **Auto Topology** function, MXview One will automatically group the IEDs within the same HSR ring into an IED Group and represent the HSR link with a purple line. If you want to display the IEDs within the Root group or display GOOSE Message information in the topology, you can use the **Ungrouping** function.

1. Navigate to **Menu** (☰) > **Topology**  
The **Topology** screen will appear and display the Topology Map by default.
2. Click on the IED group in the topology that you want to ungroup.
3. Click **Ungrouping**.

4. After ungrouping an IED group, the individual IEDs will be shown on the right-hand side of the topology.

5. Align the network connections for each IED.
- Drag and move the IEDs to their appropriate position in the topology.
  - Select the devices to draw a connection between and click **Add Link**. The **Add Link** screen will appear.

- c. Specify the device port number. You can set the port number to non-numerical mode (e.g., A, B) on the IED side.

### Add Link

From

IP Address: 192.168.127.2  
Model: ABB  
Alias: 192.168.127.2-ABB  
Port \*

A

To

IP Address: 192.168.127.25  
Model: PT-G7728  
Alias: 192.168.127.25-PT-G7728  
Port \*

21

Cancel Add

- d. Click **Add**. MXview One will draw the connection on the topology.

- e. Repeat this process for any other remaining IED connections.
6. **(Optional)** Refresh the IED information.
- a. Select one or multiple IEDs.

- b. Click **Refresh**. MXview One will retrieve the latest information from the IED.

7. (Optional) Restore the original IED group.

- a. Go to **Topology > Auto Topology**.

The **Auto Topology** screen will appear.

- b. Select **New Topology** or **Update Topology**.

- c. Click **Apply**.

MXview One will restore the topology and IED group to their original state.

## NOTE

To display GOOSE Message information on the topology, you must first ungroup the IED group, manually draw the links between the IEDs, and import the SCD file.

# Creating an IED Group

Using the **Grouping** function, you can assign multiple IEDs on the topology to a single IED group.

1. Navigate to **Menu** (☰) > **Topology**  
The **Topology** screen will appear and display the Topology Map by default.
2. Select the IEDs in the topology that you want to group together.
3. Click **Grouping**.

4. MXview One will combine the selected IEDs together and show them as a single group on the topology.  
To ungroup an IED group, refer to [Ungrouping an IED Group](#).

# Import SCD

The SCD (Substation Configuration Description) file includes the information of the critical packet – GOOSE message in the network. To visualize the GOOSE message flow in MXview Power, the user has to import the SCD file.

1. Navigate to **Menu** (☰) > **Topology**

The **Topology** screen will appear and display the Topology Map by default.

2. To import the SCD file to the Topology Map:

- a. Click **Power > Import SCD**.

The **Import SCD** screen will appear.

- b. Upload the SCD file by clicking the **File** (📁) icon. The file size must be less than 100 MB.

3. Click **Import**.

4. MXview Power will import the uploaded SCD file into the Topology Map.

If the SCD file is correct, the user will see the message below.

If the SCD file content cannot find the devices in the Topology, then MXview Power will display the missing devices and provide the steps for the user to resolve the problem.

### Failed to Import SCD File

 **Can't find the following device(s):**

**192.168.127.4**

Try these steps to resolve issues.

- 1. Add the missing device(s)**  
Click "Edit" → "Add Device".
- 2. Import the SCD file again**  
Click "Power" → "Import SCD".

Close

## GOOSE Message

MXview Power can display the GOOSE Message information on the Topology or in the IED Device Property panel by importing the SCD file. Moxa's PT switch, which was specifically designed for use in power substation systems, can detect GOOSE events. MXview Power can collect the GOOSE events and alert users when there is something wrong. Users can follow the step-by-step guidelines to solve the GOOSE events.

### GOOSE Flow

There are two roles for IED device(s): Subscriber and Publisher. The topology displays the flow of the GOOSE packet, which starts from the Publisher and ends at the Subscriber. The route you see on the GOOSE flow is not the completed GOOSE packet publishing direction. The purpose of displaying the GOOSE flow is to troubleshoot the path of the GOOSE packet for certain cases such as a GOOSE event (e.g. GOOSE Timeout, GOOSE Tampered), a device malfunction, or a link going down. The GOOSE flow will show the path the packet took to enable faster troubleshooting and minimize substation network recovery times.

## GOOSE Timeout

When a GOOSE Timeout event happens, MXview Power can display the event and indicate the possibly affected devices on the Topology by placing a yellow triangle next to them. When users click on the IED device, it will display the specific GOOSE message and will also include a Timeout status notification.

Click the **How to resolve** link and MXview Power will provide you with step-by-step instructions to solve the problem.

### Resolve GOOSE Timeout Issue

**GOOSE Timeout was caused by:**  
**Port 21 of 108.10.53.7**

Try these steps to resolve GOOSE Timeout issues.

- 1. Check the IED(s) settings**  
Make sure the GOOSE publish/subscribe messages of the IED are set correctly.
- 2. Make sure the port is not in link down status**  
Check to make sure the port of each device in the GOOSE flow (gcbGOOSE/0x0002/01:0C:CD:01:00:05) is not in link down status.
- 3. Make sure the port does not have any TX/RX errors**  
Click on a link, choose "Link Traffic" to see the "Packet Error Rate" section. Make sure the port does not have any errors.
- 4. Check if the fiber ports exceed certain thresholds**  
Click "SFP" → "SFP List". Make sure the ports do not exceed certain thresholds.

Still not working?  
Remove the SFP module and install it again.  
If you have further questions, contact your [channel partner](#) first.  
Contact [Moxa Technical Support](#) if you still need additional support.

Close

Once the problem is solved, MXview Power will provide the recovery status in the Recent Event panel and the yellow triangle will disappear.

## GOOSE Tampered

When a GOOSE Tampered event happens, MXview Power can display the event and provide the possibly affected devices on the Topology by placing a red triangle next to them. When users click on the IED device, it will display the specific GOOSE message and will also include a Tampered status notification.

Click the **How to resolve** link and MXview Power will provide you with step-by-step instructions to solve the problem.

### Resolve GOOSE Port Tampered Issue

**GOOSE Port Tampered was caused by:**

Port 3 of 108.10.53.5

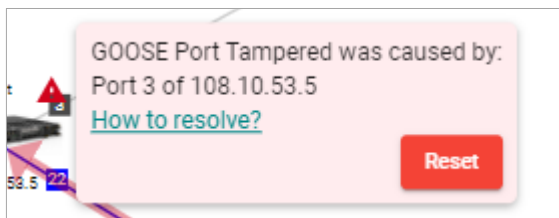

Try these steps to resolve the GOOSE Port Tampered issue

1. Check the IED(s) settings  
Make sure the GOOSE publish/subscribe messages of the IED are set correctly.
2. Check the port status  
Please check port 3 status of 108.10.53.5.

Still not working?  
If you have further questions, contact your [channel partner](#) first.  
Contact [Moxa Technical Support](#) if you still need additional support.

Close

In order to enhance security, MXview Power allows users to click the **Reset** button to clear the events log for the devices. Once the event logs are cleared, MXview Power will provide the recovery status in the Recent Event panel and the red triangle will disappear.

# 21. Security Add-on Module

---

MXview One supports several optional modules that extend the functionality of the main module. These modules require a separate license to use.

## Introduction

The MXview Security Add-on Module provides a set of features to help you easily monitor and manage the overall cybersecurity condition of your network. The add-on enables you to manage and deploy firewall policy rules and security packages to multiple devices simultaneously. Through the security dashboard featuring statistical charts, users can get important information at a glance and take necessary actions.

Additionally, the Security module instantly notifies you of any security-related issues on your network, enabling quick and easy troubleshooting.

## System Requirements

The computer that the MXview Security Add-on Module is installed on must satisfy the same system requirements as those required for MXview One. See **System Requirements** in Chapter 1 for more information.

## Supported Devices

The MXview Security Add-on Module supports the following devices:

- EDR-8010 Series
- EDR-G9004 Series
- EDR-G9010 Series
- EDF-G1002-BP Series
- TN-4900 Series

# Getting Started With the Security Add-on Module

In order to use the MXview Security Add-on module, you will need to activate it first. You can choose to activate a new license or enable the Security Add-on 90-day free version through the License Management page.

The system will automatically restart after you activate the module. A message will appear telling you to wait while the module activates. Once done, click **OK** to refresh your browser and enable the Security Add-on features.

- For detailed information on how to activate the MXview Security Add-on Module, refer to **Chapter 4: License Management**.
- To add secure devices to your MXview One network, refer to **Using Device Discovery**.

## NOTE

Please activate the Node-based License and then the Security Add-on License.

## IPS License Management

After successfully enabling a Security Add-on license, an additional **IPS** tab will become available on the **License Management** page. From this tab, users can view IPS license information and manage IPS license allocation.

IPS licenses are point-based. The combined total of all IPS license points is added to the available IPS Point Balance.

Each device with a registered IPS license will consume one IPS license point per day. The Daily Point Usage indicates the combined number of IPS license points that will be deducted from the IPS Point Balance per day.

## Viewing IPS License Information

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
2. Go to the **IPS** tab.

The **Overview** section shows the following information:

| Field                          | Description                                                                                                                        |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Name                           | The name of the license.                                                                                                           |
| IPS Point Balance              | The available IPS license points. This is the total combined points of all active IPS licenses.                                    |
| Daily Point Usage              | The number of points consumed per day by IPS-registered devices.                                                                   |
| Estimated Point Depletion Date | The estimated date that the points will be depleted. This estimate is based on the available IPS points and daily IPS point usage. |
| Status                         | The status of the license.                                                                                                         |
| UUID                           | The unique ID of this instance.                                                                                                    |

The **License History** section shows the following information:

| Field           | Description                              |
|-----------------|------------------------------------------|
| Date Created    | The date of this license was added.      |
| Activation Code | The activation code of the license.      |
| License Type    | The type of license.                     |
| License Points  | The number of IPS points on the license. |

## Adding an IPS License

Adding an IPS license requires a valid license activation code.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.

- Click **Add New License**.  
The **Add New License** screen will appear.

- Follow the on-screen instructions for activating the license on the Moxa License Site.
- Enter the activation code provided by the Moxa License Site into MXview One.

- Click **Apply**.
- Verify the license is correct.

## Registering an IPS-licensed Device

To enable full IPS functionality on a device, you must register the device as an IPS-licensed device. Once registered, the device will consume one IPS license point per day.

- Navigate to **Menu** (☰) > **Administration** > **License Management**.
- Go to the **IPS** tab.
- In the IPS License Management section, check the box of the device(s) you want to register as IPS-licensed.
- Click the **Register** (🔑) icon.  
The **Register as IPS-licensed Device(s)** screen will appear.

- When prompted to confirm, click **Register**.

6. If a device already has a device-based IPS (IPS-DEVICE) license assigned to it, a notification will appear.

7. Click **Register** to reclaim the device-based IPS licenses and register the device(s) as IPS-licensed.

## NOTE

When reclaiming a device-based IPS (IPS-DEVICE) license, MXview One will reclaim and reassign the license as a centrally managed IPS license. The original license will be added to the total IPS point balance.

## Deregistering an IPS-licensed Device

You can deregister an IPS license from a managed device to assign it to another device. Deregistering an IPS license will cause IPS pattern updates to become unavailable on that device until it is registered as an IPS-licensed device again.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
2. Go to the **IPS** tab.
3. In the IPS License Management section, check the box of the device(s) you want to deregister the IPS license for.
4. Click the **Deregister** (🗑️) icon.

5. When prompted to confirm, click **Deregister**.

## Transferring an IPS License

Under some circumstances, you may need to migrate MXview One to a new host system. To transfer your IPS licenses to another instance of MXview One, you must deactivate them on the current system first and reactivate the license(s) on the new MXview One instance.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.

2. Go to the **IPS** tab.
3. In the License History section, click the **Deactivate** (🗑️) icon to deactivate all active IPS licenses.

4. When prompted to confirm, click **Deactivate**.

## NOTE

If more than one IPS license was deactivated, all remaining license points will be combined into a single license.

5. The **Reactivate IPS Licenses on New Instance** window will automatically appear.

If you closed this window, you can reopen it at any time by clicking **Reactivate** in the Deactivated Licenses section.

6. Follow the steps in the reactivation wizard to complete the license transfer process.

## Configuring IPS License Depletion Notifications

You can set up notifications to inform you when your IPS license point balance is about to run out.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
2. Go to the **IPS** tab.

- Click **License Depletion Notifications**.  
The **License Depletion Notifications** screen will appear.

**License Depletion Notifications**

Status \*  
☒ Enabled ☐ Disabled

Trigger  
 Less than \*  
 7  
 7 - 180 days remaining

Email Recipient \*

Notification Frequency \*  
 Monthly

Cancel Apply

- Select the notification status. If set to **Enabled**, configure the following settings:
  - **Trigger:** Specify the number of days before the IPS point balance is depleted. A notification will be sent when this threshold is reached. Days remaining are calculated based on the total available IPS point balance divided by the daily point usage.
  - **Email Recipient:** Enter the email address of the notification recipient. SMTP settings must be configured first before notifications can be set up. Refer to **Configuring Email Server Settings**.
  - **Notification Frequency:** Select the frequency at which notifications will be sent.
- Click **Apply**.

## Checking Registered Devices

MXview One can automatically check for and register devices that support MXview Security features. You can see the registration status on the **Topology** or **Device Management** page.

- To check the device registration status from the **Topology** screen:
  - Navigate to **Menu** (☰) > **Topology**.
  - Click the **List View** (☰) icon.

Devices in the topology will be shown in a list.

| Device Alias                                      | Security Add-On | Model     | Device IP      | MAC Address       | Firmware Version | Location        |
|---------------------------------------------------|-----------------|-----------|----------------|-------------------|------------------|-----------------|
| <input type="checkbox"/> 192.168.127.11-EDS-G516E | N/A             | EDS-G516E | 192.168.127.11 | 00:90:E8:54:E1:E6 |                  |                 |
| <input type="checkbox"/> 192.168.127.35-EDR-9010  | Registered      | EDR-9010  | 192.168.127.35 | 00:90:E8:91:86:82 |                  | Switch Location |
| <input type="checkbox"/> 192.168.127.82-EDR-8010  | Unregistered    | EDR-8010  | 192.168.127.82 | 00:90:E8:91:86:82 |                  | Switch Location |

Items per page: 50 1 - 10 of 10 [< > >]

- To check the device registration status from the **Device Management** screen:

- a. Navigate to **Menu** (☰) > **Device Management** > **Configuration and Control**.

The screenshot shows the MXview ONE web interface. At the top, there's a header with the MXview ONE logo, language (English), and user (admin). Below the header, there's a navigation bar with tabs: Select Operation, Device Configuration, Device Control, Cybersecurity Control, and Execute CLI. The main content area displays a table with columns: Device Alias, Security Add-On, Model, Device IP, MAC Address, Firmware Version, and Location. The table contains three rows of device information. At the bottom right, there's a pagination control showing 'Items per page: 50' and '1 - 10 of 10'.

| <input type="checkbox"/> | Device Alias             | Security Add-On | Model     | Device IP      | MAC Address       | Firmware Version | Location        |
|--------------------------|--------------------------|-----------------|-----------|----------------|-------------------|------------------|-----------------|
| <input type="checkbox"/> | 192.168.127.11-EDS-GS16E | N/A             | EDS-GS16E | 192.168.127.11 | 00:90:E8:54:E1:E6 |                  |                 |
| <input type="checkbox"/> | 192.168.127.35-EDR-9010  | Registered      | EDR-9010  | 192.168.127.35 | 00:90:E8:91:86:82 |                  | Switch Location |
| <input type="checkbox"/> | 192.168.127.82-EDR-8010  | Unregistered    | EDR-8010  | 192.168.127.82 | 00:90:E8:91:86:82 |                  | Switch Location |

3. Check the registration status of the device in the **Security Add-on** column:
- **Registered:** The device can be managed in the Security Add-on module and has been successfully registered.
  - **Unregistered:** The device can be managed in the Security Add-on module, but it has not been successfully registered yet. Some functions such as firewall policies cannot be deployed on unregistered devices.
  - **N/A:** The device cannot be managed in the Security Add-on module.

## NOTE

If the status is **Unregistered**, confirm the device account and password in **Device Configuration > Device Accounts** are correct or reboot the device.

# Security Module Features

The MXview Security Add-on Module offers a set of features specifically designed to help you monitor and troubleshoot your network more easily.

## Main Dashboard

If the Security module is activated, the MXview One Dashboard will include a Cybersecurity tab with widgets showing cybersecurity event statistics.

To access the Dashboard, navigate to **Menu** (☰) > **Dashboard** > **Cybersecurity**.

The following widgets will appear in the Cybersecurity tab, depending on the types of security events that have occurred on the network. Click the **Refresh All** (🔄) icon in the top-right to update the data of all the widgets.

- Top 5 Layer 3-7 Policy Events by Source IP
- Top 5 Layer 3-7 Policy Events by Destination IP
- Top 5 IPS Policy Events by Source IP
- Top 5 IPS Policy Events by Destination IP
- Top 5 Protocol Filter Policy Events by Source IP
- Top 5 Protocol Filter Policy Events by Destination IP
- Top 5 ADP Policy Events by Source IP
- Top 5 ADP Policy Events by Destination IP

To check detailed information, click the bar of the corresponding IP address in the widget, or click **Show Event Log** at the bottom of each widget to jump to the cybersecurity event log.

## Policy Profile Management

This section allows users to manage policy profiles, inspection objects, and interface objects that can be applied to multiple devices.

This section contains the following tabs:

- **Policy Profile:** Manage policy profiles for devices.
- **Inspection Object:** Manage inspection objects for policy profiles.
- **Interface Object:** Manage interface objects for policy profiles.

## Policy Profiles

To access the **Policy Profile** page, in the function tree, navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management** and go to the **Policy Profile** tab.

1 - 2 of 2

Policy profiles aggregate various firewall policies and can be deployed to devices based on network security requirements.

You can configure the following types of policies:

- **Layer 3-7 Policy:** Provides secure traffic control, allowing users to control network traffic based on security needs.
- **Session Control:** Protects network hosts or services from exceeding performance limitations.
- **DoS Policy:** Provides different DoS protection functions for detecting or defining abnormal packet formats or traffic flows.
- **IPS Policy:** Performs intrusion detection and prevention to protect networks from security threats.

## NOTE

"**Device in Use**" indicates the number of devices the policy profile is being used by. Policy profiles applied to devices cannot be deleted. Click the "..." icon in the column to see details about the referenced device(s).

## NOTE

"**Schedule in Use**" indicates there is an upcoming scheduled deployment to apply this policy profile to the referenced device(s). To avoid any disruptions or deployment failures, policy profiles with planned deployments cannot be deleted.

## Creating a Layer 3-7 Policy Profile

1. Navigate to **Menu** () > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Policy Profile** tab.
3. Click the **Add** () icon in the top-left corner to create a new policy profile.

8. Click **Create** to create the Session Control policy.
9. Click **Apply**.

## Creating a DoS Policy Profile

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Policy Profile** tab.

- Click the **Add** (+) icon in the top-left corner to create a new policy profile.

The **Create Policy Profile** will appear.

- Enter a name and description for the profile.
- Expand the **DoS** profile options.

- Configure the following settings:
  - **DoS Settings:** Check the box of the DoS types you want to enable. If necessary, specify the packet limit.
  - **Log:** Enable or disable event logs.
  - **Severity:** Select the log severity level.
  - **Destination:** If logging is enabled, choose where the logs will be stored. Multiple options can be selected.
- Click **Apply**.

## Creating an IPS Policy Profile

- Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
- Go to the **Policy Profile** tab.

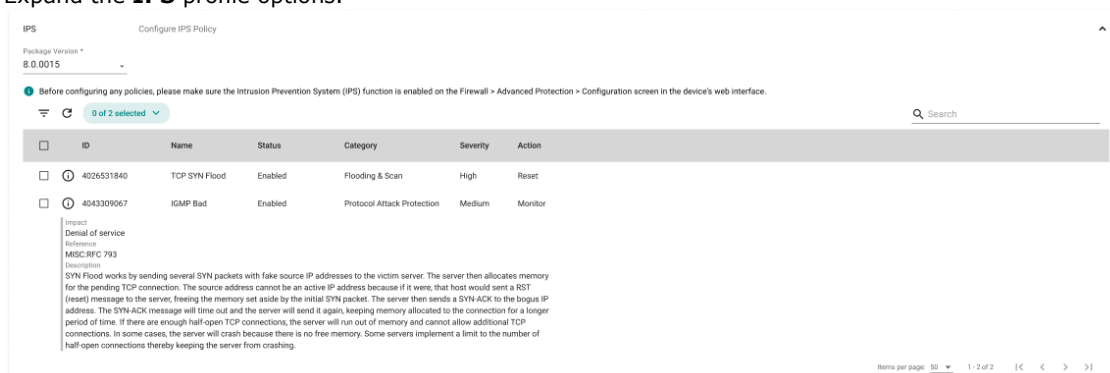

- Click the **Add (+)** icon in the top-left corner to create a new policy profile.

The **Create Policy Profile** will appear.

- Enter a name and description for the profile.
- Expand the **IPS** profile options.

- Select a previously uploaded IPS software package version. Refer to [Security Package Management](#) for more information.

- In the IPS rule table, check the box of the rule(s) you want to configure. You can select multiple rules at once.

8. Click the **Rule Settings** (⚙️) icon.  
The **Rule Settings** screen will appear.

**Rule Settings**

Status \*

9. Configure the following settings:
  - **Status:** Enable or disable the selected rule(s).
  - **Action:** Select the action when traffic matches the policy rule.
10. Click **Apply**.
11. On the **Policy Profile** screen, click **Apply**.

## Editing a Policy Profile

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Policy Profile** tab.
3. Click the **Edit** (✎) icon of the profile you want to edit.
4. Modify the profile settings. Refer to the corresponding section for settings information:
  - [Creating a Layer 3-7 Policy Profile](#)
  - [Creating a Session Control Policy Profile](#)
  - [Creating a DoS Policy Profile](#)
  - [Creating an IPS Policy Profile](#)
5. Click **Apply**.

## Deleting a Policy Profile

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Policy Profile** tab.
3. Check the box of the policy profile(s) you want to delete.
4. Click the **Delete** (🗑️) icon.
5. When prompted to confirm, click **Delete**.

## Inspection Objects

To access the **Inspection Object** page, in the function tree, navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management** and go to the **Inspection Object** tab.

| Policy Profile Management                                                                       |            |                       |                            |            |

| <input type="checkbox"/>                                                                        | Name       | Type                  | Detail                     | References |
| <input type="checkbox"/>                                                                        | ✎ UDP      | User-defined Service  | UDP 5555                   | 0          |
| <input type="checkbox"/>                                                                        | ✎ IP Range | IP Address and Subnet | 192.168.1.1 - 192.168.1.10 | 1 ...      |

1 - 2 of 2

Inspection objects contain the IP address and subnet, network services, industrial application services, and user-defined services that are applied to policy rules using the object.

## Creating an Inspection Object

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Inspection Object** tab.
3. Click the **Add** (+) icon in the top-left corner to create a new inspection object.

The **Create Object** window will appear.

4. Configure the following settings:
  - **Name:** Enter a name for the object.
  - **Object Type:** Select the object type. Depending on the selected object, configure the following settings:
    - ☐ **IP Address and Subnet:** Depending on the selected IP Type, enter the IP address, IP range, or subnet.
    - ☐ **Network Service:** Check the box of the service(s) you want to add to the object.
    - ☐ **Industrial Application Service:** Check the box of the industrial application service(s) you want to add to the object.
    - ☐ **User-defined Service:** Select the IP protocol. Depending on the selected protocol, specify the port, port range, ICMP Type and Code, or protocol decimal
5. Click **Create**.

## Editing an Inspection Object

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Inspection Object** tab.
3. Click the **Edit** (✎) icon of the object you want to edit.
4. Modify the object settings.
5. Click **Apply**.

## Deleting an Inspection Object

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Inspection Object** tab.
3. Check the box of the object(s) you want to delete.
4. Click the **Delete** (🗑) icon.
5. When prompted to confirm, click **Delete**.

## Interface Objects

To access the **Interface Object** page, in the function tree, navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management** and go to the **Interface Object** tab.

Interface objects contain the VLAN interface and bridge interface that are applied to policy rules using the object.

## Creating an Interface Object

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Interface Object** tab.
3. Click the **Add** (+) icon in the top-left corner to create a new interface object.

The **Create Interface** window will appear.

4. Configure the following settings:
  - **Name:** Enter a name for the object.
  - **Mode:** Select the interface mode. If set to VLAN, specify the VLAN ID. If set to Bridge, select the Bridge mode.
5. Click **Apply**.

## Editing an Interface Object

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Interface Object** tab.
3. Click the **Edit** (✎) icon of the object you want to edit.
4. Modify the object settings.
5. Click **Apply**.

## Deleting an Interface Object

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Management**.
2. Go to the **Interface Object** tab.
3. Check the box of the object(s) you want to delete.
4. Click the **Delete** (🗑️) icon.
5. When prompted to confirm, click **Delete**.

# Policy Profile Deployment

To access the **Policy Profile Deployment** page, in the function tree, navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Deployment**.

## Policy Profile Deployment

0 device(s) selected

Search

| <input type="checkbox"/> | Device Name | Online      | Status / Profile Name | Scheduling            | Last Update Time             | Product Model        | Device IP      | MAC               | Serial Number | Location     |

From this screen, users can deploy policy profiles to multiple managed devices at a time and check the synchronization status.

## Deploying Policy Profiles to Managed Devices

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Deployment**.
2. Check the box of the device(s) you want to apply a policy profile to.
3. Click the **Sync Profile** (↻) icon in the top-left corner.  
The **Sync Profile to Device(s)** window will appear.

Sync Profile To Device(s)

2 item(s) selected

Profile Name \*

EDtest-policyProfile

CANCEL APPLY

4. Select a previously configured policy profile. Refer to [Policy Profile Management](#) for instructions on how to create policy profiles.
5. Click **Apply**.

### NOTE

You can also deploy policy profiles via **Topology** > **Cybersecurity Controls** > **Policy Profile Deployment** or via **Device Management** > **Configuration and Control** > **Cybersecurity Controls** > **Policy Profile Deployment**.

## Scheduling a Policy Profile Deployment for Managed Devices

Deploying a policy profile to a device may disrupt services or operations. To minimize the potential impact of policy profile deployments, users can schedule the deployment for specific times where they are least likely to affect operations. Schedules can be configured to execute only once, or on a daily or weekly recurring basis.

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Deployment**.
2. Check the box of the device(s) you want to configure a scheduled deployment for.

3. Click the **Schedule Settings** (📅) icon in the top-left corner.  
The **Schedule Settings** window will appear.

4. Configure the following settings:
  - **Select File:** Select a policy profile to apply to the selected device(s).
  - **Scheduling Mode:** Select a scheduling mode. Depending on the selected mode, configure the following settings:
    - ☐ **One Time:** Select the date and time. One-time schedules can be configured for up to 30 days in the future.
    - ☐ **Daily:** Select the time and the schedule period. Daily schedules can be configured for up to 90 days in the future.
    - ☐ **Weekly:** Select the day of the week, the time, and schedule period. Weekly schedules can be configured for up to 90 days in the future.
5. Click **Apply**.

## Deleting a Scheduled Profile Policy Deployment

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Policy Profile Deployment**.
2. Check the box of the device(s) with the scheduled deployment you want to delete.
3. Click the **Delete Schedule** (🗑️) icon.
4. When prompted to confirm, click **Delete**.

# Security Package Management

This section describes how to manage the security package either manually from a local PC or automatically by updating to the Moxa Update Server.

This section contains the following tabs:

- **Security Package Files:** Manage security package files for supported devices.
- **Log:** Shows security package-related event logs.
- **Update Settings:** Configure scheduled security package update checks.

## Security Package Files

From the **Security Package Files** tab, you can update and manage security package files.

### Checking the Security Package Status

The **Update Security Package** section provides information about the Moxa Update Server connection status, the time and date of the last update check, and the result of the last check.

To access this section, navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.

The widget shows the following information:

| Field                               | Description                                                           |
|-------------------------------------|-----------------------------------------------------------------------|
| Moxa Update Server Status           | Shows the current status of the connection to the Moxa update server. |
| Last Connection Check               | Shows the date and time of the last connection check.                 |
| Last Security Package Update Result | Shows the result of the most recent security package update check.    |

To manually check for security package updates, click the **Check Security Package** button. A list of models and any available security package updates will be shown. The models shown in the list are configured in the **Update Settings** tab. To set up a scheduled update check, refer to [Scheduling a Security Package Update Check](#).

## Uploading a Security Package

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.
2. Go to the **Security Package Files** tab.
3. Click the **Add** (+) icon in the top-left corner to upload a security package.  
The **Upload Package** window will appear.

4. Drag and drop or browse to the package file on the local computer and enter a description for the file.

5. Click **Upload**.

## NOTE

"**Profile in Use**" indicates the number of policy profiles using the corresponding security package. Package files used by policy profiles cannot be deleted. Click the "..." icon in the column to see details about the referenced policy profile(s).

## NOTE

"**Schedule in Use**" indicates there is an upcoming scheduled deployment to apply this security package to the referenced device(s). To avoid any disruptions or deployment failures, security packages with planned deployments cannot be deleted.

## Viewing Detailed Security Package Information

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.
2. Go to the **Security Package Files** tab.
3. In the package file list, click the **Info** (ℹ) icon of the package file you want to view details for.
4. Click the **Info** (ℹ) icon again to close the details section.

## Downloading a Security Package

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.
2. Go to the **Security Package Files** tab.
3. In the package file list, click the **Download** (⬇) icon of the package file you want to download.

## Deleting a Security Package

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.
2. Go to the **Security Package Files** tab.
3. Check the box of the package(s) you want to delete.
4. Click the **Delete** (🗑) icon.
5. When prompted to confirm, click **Delete**.

## Event Logs

From the **Event Logs** tab, you can view security package files event logs.

## Viewing Security Package Logs

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.
2. Go to the **Event Logs** tab.
3. You can perform the following actions:
  - a. Click the **Download All Logs** (📄) icon to export the current search results as a CSV file.
  - b. Click the **Refresh** (↻) icon to update the event log table.

The event log table shows the following information:

| Field    | Description                               |
|----------|-------------------------------------------|
| Time     | The time the log entry was created.       |
| Severity | The severity level assigned to the event. |
| Event    | The category of the event.                |
| Message  | Additional details about the event.       |

## Scheduled Update Check

From the **Scheduled Update Check** tab, you can configure a scheduled time and period to automatically check the Moxa server for security package updates.

### Scheduling a Security Package Update Check

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Management**.
2. Go to the **Update Settings** tab.

### Security Package Management

**Update Security Package** ⓘ  
Moxa Update Server Status : ✓ Connected [Check Now](#)

3. Set **Scheduled Update Check** to **Enabled**.
4. Choose a scheduling mode:

- **Daily:** Set the time of the day to perform the check.
  - **Weekly:** Set the day of the week and time of the day to perform the check.
5. Configure the update period. The system will only perform update checks on the specified time and date during this period.
  6. Select the product model(s). The system will only check for security package updates applicable to the select product models.
  7. Click **Apply**.

## Security Package Deployment

This section allows users to deploy security packages to managed devices.

### Upgrading the Security Package of Managed Devices

Users can manually upgrade the security package of managed devices and check basic security package version information.

The table shows the following security package information:

- **Package Version:** Shows the version of the security package currently installed on the device.
- **Up-to-date:** Indicates if the currently installed version is up to date. If not, the latest available version will be shown.

| Device Name               | Online | Product Model        | Device IP      | Serial Number | MAC               | Package Version | Firmware Version | Up-to-date | Scheduling | Last Update Time | Location        |
|---------------------------|--------|----------------------|----------------|---------------|-------------------|-----------------|------------------|------------|------------|------------------|-----------------|
| Firewall/VPN Router 00000 | ●      | EDR-8010-VPN-2GSFP   | 192.168.127.82 | TBZKB1155166  | 00:90:EB:80:10:A4 | v10.0.0023      | V3.13.99         |            |            |                  | 25.058, 121.453 |
| Firewall/VPN Router 55165 | ●      | EDR-G9010-VPN-2MGSFP | 192.168.127.35 | TBZKB1155165  | 00:90:EB:91:86:82 | v10.0.0023      | V3.13.99         |            |            |                  | Device Location |

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Deployment**.
  2. Check the box of the device(s) you want to upgrade the security package for.
  3. Click the **Upgrade** (⬆) icon to upgrade the security package for the selected device(s).
- The **Upgrade Package** window will appear.

### Upgrade Package

1 item(s) selected

No version available

Check the security packages on the Security Package Management page.

Cancel Upgrade

4. Select a previously uploaded security package to upgrade to. Refer to [Uploading a Security Package](#) for instructions on how to upload security packages.
5. Click **Upgrade**.

### Scheduling a Security Package Deployment for Managed Devices

Deploying a security package to a device may disrupt services or operations. To minimize the potential impact of security package deployments, users can schedule the deployment for specific times where they are least likely to affect operations. Schedules can be configured to execute only once, or on a daily or weekly recurring basis.

Users can choose to deploy a specific version or the most-recent version of the security package available in the management database.

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Deployment**.
2. Check the box of the device(s) you want to configure a scheduled deployment for.
3. Click the **Schedule Settings** (📅) icon in the top-left corner.

The **Schedule Settings** window will appear.

4. Configure the following settings:
  - **Select File:** Select a security package version to apply to the selected device(s).
  - **Scheduling Mode:** Select a scheduling mode. Depending on the selected mode, configure the following settings:
    - ☐ **One Time:** Select the date and time. One-time schedules can be configured for up to 30 days in the future.
    - ☐ **Daily:** Select the time and the schedule period. Daily schedules can be configured for up to 90 days in the future.
    - ☐ **Weekly:** Select the day of the week, the time, and schedule period. Weekly schedules can be configured for up to 90 days in the future.
5. Click **Apply**.

## Deleting a Scheduled Security Package Deployment

1. Navigate to **Menu** (☰) > **Firewall Policy Management** > **Security Package Deployment**.
2. Check the box of the device(s) with the scheduled deployment you want to delete.
3. Click the **Delete Schedule** (🗑️) icon.
4. When prompted to confirm, click **Delete**.

## Cybersecurity Event Log

If the MXview Security add-on license is activated, an additional Cybersecurity tab will be available on the **Event History** page, showing security events occurring on devices. The events include logs detected by the Trusted Access, Malformed Packets, DoS Policy, L2 Policy, L3-L7 Policy, Protocol Filter Policy, ADP, IPS, and Session Control functions. Refer to [Viewing Event History](#).

The table shows the following information:

| Field              | Description                                                        |
|--------------------|--------------------------------------------------------------------|
| Time               | The time the event entry was created.                              |
| Severity           | The severity level assigned to the event.                          |
| Device Name        | The host name of the device that generated the event.              |
| IPS Severity       | The severity level assigned to the IPS event.                      |
| IPS Category       | The category of the IPS event.                                     |
| Ether Type         | The Ethernet type of the connection.                               |
| IP Protocol        | The IP protocol of the connection.                                 |
| Incoming Interface | The name of the incoming interface where the event was registered. |
| Source MAC         | The source MAC address of the connection.                          |
| Source IP          | The source IP address of the connection.                           |
| Source Port        | The source port of the connection.                                 |
| Outgoing Interface | The name of the outgoing interface where the event was registered. |
| Destination IP     | The destination IP address of the connection.                      |
| Destination Port   | The destination port of the connection.                            |
| TCP Flags          | The TCP flags of the TCP protocol.                                 |
| ICMP Type          | The ICMP type of the ICMP protocol.                                |
| ICMP Code          | The ICMP Code of the ICMP protocol.                                |
| Action             | The action performed based on the policy settings.                 |
| Additional Message | The additional message provided with the event.                    |

## Viewing Cybersecurity Events

1. Navigate to **Menu** (☰) > **Event Management** > **Event History** > **Cybersecurity**.
2. Select the event type from the drop-down menu.

3. To filter event logs:

- a. Click the **Filter** (  ) icon to open the filter menu. Select a start/end date and time or severity from the respective drop-menu.

- b. Click the **Options** (  ) icon to configure advanced filters. Check the box of the specific event(s) you want to filter and click **Apply**. The event log will refresh immediately to reflect the selected criteria.
4. To export logs:
  - a. Click the **Download All Logs** (  ) icon to export the current results as a CSV file
5. To refresh the event log data:
  - a. Click the **Refresh** (  ) icon to renew the search results.

## Cybersecurity Event Settings

If the MXview Security add-on license is activated, an additional **Cybersecurity Event** tab will be added to the **Event Settings** screen. From this tab, users can configure events for specific cybersecurity events. Refer to [Events and Notifications](#).

## Adding a Cybersecurity Event

1. Navigate to **Menu** (  ) > **Event Management** > **Event Settings** > **Cybersecurity Event**.

2. Click the **Add (+)** icon in the top-left corner.

The **Add Cybersecurity Event** window will appear.

The screenshot shows the 'Add Cybersecurity Event' window with the first step, 'Notification Information', selected. It includes a progress bar with three steps: '1 Notification Information', '2 Choose Devices', and '3 Choose Event and Filter'. Below the progress bar, there is a 'Status \*' section with radio buttons for 'Enabled' (selected) and 'Disabled'. There is also an 'Event Name \*' text field with a character count '0 / 50' and a 'Description' text field with a character count '0 / 255'. At the bottom right, there are 'Cancel' and 'Next' buttons.

3. Enter a name and description for the event.
4. Click **Next**.
5. Select the device(s) that will send notifications for the specified event(s).

The screenshot shows the 'Add Cybersecurity Event' window with the second step, 'Choose Devices', selected. It includes a progress bar with three steps: '1 Notification Information', '2 Choose Devices', and '3 Choose Event and Filter'. Below the progress bar, there is a '0 of 2 selected' indicator and a search bar. A table lists two devices:

|                          | Device Name ↑             | Status | Location        | Product Model        | Serial Number | MAC Address       | Firmware Version |
|--------------------------|---------------------------|--------|-----------------|----------------------|---------------|-------------------|------------------|
| <input type="checkbox"/> | Firewall/VPN Router 00000 | ●      | 25.058, 121.453 | EDR-8010-VPN-2GSFP   | TBZKB1155166  | 00:90:E8:80:10:A4 | V3.13.99         |
| <input type="checkbox"/> | Firewall/VPN Router 55165 | ●      | Device Location | EDR-G9010-VPN-2MGSFP | TBZKB1155165  | 00:90:E8:91:86:82 | V3.13.99         |

At the bottom right, there are 'Back' and 'Next' buttons.

6. Click **Next**.
7. Select the event type and configure the filter rules.
  - a. Select the notification event type from the drop-down menu.

The screenshot shows the 'Add Cybersecurity Event' window with the third step, 'Choose Event and Filter', selected. It includes a progress bar with three steps: '1 Notification Information', '2 Choose Devices', and '3 Choose Event and Filter'. Below the progress bar, there is a 'Notification Event \*' dropdown menu with 'Trusted Access' selected. There is also an 'Event Filter Rule' section with checkboxes for 'Severity', 'Source IP', and 'Destination IP'. Below these checkboxes, there are input fields for 'Severity Rule', 'Severity Mode', 'Source IP', and 'Destination IP'. At the bottom right, there are 'Back' and 'Apply' buttons.

- b. Specify the notification filter rules to determine when the device will send a notification for the event. Filter rule options may differ depending on the selected event type.

**Add Cybersecurity Event**

Severity Rule Severity Mode

☐ Source IP ☐ Destination IP

Source IP Destination IP

Back Apply

8. Click **Apply**.

## Adding a Cybersecurity Event Notification

If the MXview Security is enabled, an additional **Cybersecurity Event** category will be added to the **Notification Management** function. This allows users to set up notifications to alert users when specific cybersecurity events occur on the network.

Refer to [Configuring New Event Notifications](#) for information and instructions on how to configure event notifications.

## IPS Configuration

Use the **IPS Configuration** function to configure IPS settings for one or multiple selected devices at once.

### Configuring IPS Settings

1. Navigate to **Menu** (☰) > **Device Management** > **Cybersecurity Controls** > **IPS Configuration**. The **IPS Configuration** window will appear.

**IPS Configuration**

IPS \* IPS Operation Mode \*

| IP             | Alias                   | Model    |
|----------------|-------------------------|----------|
| 192.168.127.82 | 192.168.127.82-EDR-8010 | EDR-8010 |

Cancel Apply

### NOTE

To configure IPS settings for multiple devices, navigate to **Topology**. On the topology screen, select the devices and navigate to **Cybersecurity Controls** > **IPS Configuration** in the function bar.

2. Configure the following settings:
- **IPS**: Enable or disable IPS functionality.
  - **IPS Operation Mode**: Select an IPS operation mode.
    - ☐ **Detection Mode**: In this mode, the system monitors traffic matching IPS rules configured on the selected device(s) to generate event logs but will not block any traffic.

- ❑ **Prevention Mode:** In this mode, the system will block any traffic that matches IPS rules configured on the selected device(s).

3. Click **Apply**.
4. The **Status** column will show the progress of the IPS configuration.

| IPS Configuration |                         |          |                 |
|-------------------|-------------------------|----------|-----------------|
| IP                | Alias                   | Model    | Status          |
| 192.168.127.82    | 192.168.127.82-EDR-8010 | EDR-8010 | In Progress ... |

If successful, the status will show as **Finished**.

| IPS Configuration |                         |          |                       |
|-------------------|-------------------------|----------|-----------------------|
| IP                | Alias                   | Model    | Status                |
| 192.168.127.82    | 192.168.127.82-EDR-8010 | EDR-8010 | Finished              |
|                   |                         |          | <a href="#">Close</a> |

If unsuccessful, an error description will be shown for troubleshooting.

| IPS Configuration |                         |          |                           |
|-------------------|-------------------------|----------|---------------------------|
| IP                | Alias                   | Model    | Status                    |
| 192.168.127.82    | 192.168.127.82-EDR-8010 | EDR-8010 | Failed(IPS not supported) |
|                   |                         |          | <a href="#">Close</a>     |

5. Click **Close** to close the status window.
